Washing of feet, a ceremony in the Roman Catholic, Greek, Russian, and some other churches, as those of the Dinkers, Winebremerians, etc., in commemoration of Christ's washing of the feet of his disciples after the last supper (John xiii. 4-17), both as a symbol of spiritual cleansing and as a lesson to them of humility and good will. The washing of others' feet, for their relief from the effects of exposure in a hot climate with but slight or no covering, has always been a common practice in Oriental countries, generally performed by menials; and religious ideas have often been associated with the practice. In the Roman Catholic Church the ceremony is observed on Thursday of Holy Week. The pope washes the feet of thirteen poor priests, and the principal priests or prelates of the Roman Catholic churches wash the feet of twelve poor persons. The ceremony is also called *mandatum* or *mandy*. See *Mandy Thursday*.

The sturdy plowman, lustie, strong, and bold,
Overcometh the winter with driving the foot-ball,
Forgetting labour and many a grievous fall.
Alex. Barclay, quoted in Strutt's Sports and Pastimes, [p. 169].

2. A game played with such a ball by two parties of players on a level plot of ground, at each end of which is a goal through or beyond which the players strive to drive the ball. There are various ways of playing the game, the two most commonly recognized being the "Association" and the "Rugby" game, the latter either in its original form or as played in America in a modified form. The field is 330 feet long by 160 wide, and in the middle of each end is a goal formed of two upright posts, in the Rugby game 18½ feet apart with a cross-bar 10 feet above the ground, and in the Association game 24 feet apart with a cross-bar 8 feet from the ground. There are 11 players on each side (in the Rugby game sometimes 15), divided into *rushers* and *backs*; the special object of the former being to check their opponents and to rush or push forward the ball in a body, and of the latter to kick or run with the ball. The two sides cast lots, the winner having the privilege of beginning the game with possession of the ball, or of selecting the goal. In the Rugby game the players can kick, run with, or throw the ball (but not throw it forward toward their opponents' goal); in the Association game they can only kick it. The playing is begun by kicking off the ball from midway between the goals, and the players strive to force the ball through or beyond their opponents' goal. In the Association game, to win a goal the ball must be kicked through the goal below the cross-bar, and the side securing the largest number of goals wins the game. In the Rugby game scoring is by *goals*, *touch-downs*, and *safety touch-downs* or *safeties*. A goal is won by kicking the ball through or above the goal posts over the cross-bar; a touch-down, by carrying the ball behind the goal and then touching it to the ground, which gives the player a try—that is, the right to carry the ball out in front of the goal and try to kick a goal; a safety touch-down or safety, by forcing one's opponents to touch the ball to the ground behind one's own goal. The play continues for a certain length of time (in 1894 one hour and ten minutes), divided into two parts by a short intermission, at which time the players change sides. Football is an ancient game, probably introduced into Great Britain by the Romans, though the first distinct mention of it is in Fitzstephen's History of London, about 1175.

different developments (oppositeness, negation, difference, change, deterioration) of the radical meaning 'before,' and varying in its force accordingly; akin to *for*, *ford*, etc., and ult. to the L., Gr., and Skt. forms cited under *for*. The three Goth. forms *fira*, *foua*, *fura*, are phonetically near to Gr. *para*, before, beside, *para*, around, and *para*, before, respectively.

See further under *for*, *prep*. In some words *for*-1 has become confused with *for*-2, equiv. to *for*-1; e. g., *for*go² for *for*go¹, *for*ward¹ for *for*ward², *for*ward² for *for*ward¹, *for*ward² for *for*ward¹, etc. See *for*-3.]

An inseparable prefix in words of Middle English and Anglo-Saxon origin, formerly attachable at will to any verb admitting of the qualification conveyed by this prefix, but no longer used or felt as a living formative. In Middle English and Anglo-Saxon it conveyed various notions, as oppositeness, negation, difference, change, deterioration, etc., often intensity, these notions being traceable in the modern words; thus *for*-1 is negative in *for*bid, *for*swear, negative or pejorative in *for*speak, etc., alternative in *for*shape, etc., intensive in *for*born, *for*sworn, *for*unwielded, *for*went, etc. From its intensive use in participial forms of verbs it came to be used also as an intensive prefix to adjectives, as in *for*black, very black, *for*den, very dry, etc. (See the etymology, and compare *for*-2.) This prefix, once extremely common, has not only ceased to be used in forming new words, but most of the old words containing it have become obsolete, *for*beare, *for*bid, *for*get, *for*give, *for*go, *for*give, *for*sear, and *for*born in its adjectival use being the only ones now in familiar use. Only the principal Middle English words with this prefix are entered in this dictionary.

moving along a curved path into a component accelerative elongation of the radius of curvature of the path ($md^2\rho/dt^2$), due to the inertia of the particle; inertia considered as the cause of such acceleration. If, while a wheel is revolving uniformly, a particle is suddenly released from its periphery, this particle will (in the absence of forces) fly off on a tangent without change of velocity. The path of the particle, considered as relative to the revolving wheel, is an involute of the circle. Hence, at the instant of release the direction of the relative motion of the particle is radial to the wheel, and it can be shown that, while the velocity of this motion would be null at that instant, its acceleration would be equal to the square of the velocity of the particle divided by the radius of the wheel. It is simplest to say that this accelerative elongation of the radius vector always takes place, and that if, notwithstanding, the particle does not leave the wheel, it is because the centrifugal acceleration due to inertia is precisely balanced by a centripetal acceleration due to the forces which hold the particle in place. But the centrifugal force does not at all depend upon the principle of action and reaction. If a particle moves upon any curved path whatever, any infinitesimal part of this path is occupied by a circle, and inertia will produce the same accelerative elongation of the radius vector from the center of this circle as before; and this radius vector is the radius of curvature of the path. As thus defined, the centrifugal force is not a true force, since it results from the resolution of the motion into a radial and a circular part, while the principle of the parallelogram of forces (see def. 8 (a)) forbids such a resolution of forces proper. Thus, if a particle moves in a circular orbit about an attracting center, since the radius of curvature is constant, the centrifugal force must be balanced by a precisely equal and opposite attracting force. But a body which was really subjected to two equal and opposite forces would move as if subjected to none—that is, not in a circle, but in a straight line. The fact is that the only influences to which the body is subjected are I , its inertia, and A , the attraction—that is, $I + A$. The centrifugal force is equal to $-A$, and balances the attraction, but it is a part of the inertia, the remainder of which is $I + A$. (b) In an erroneous use, a repulsive force causing a revolving body to fly away from the center of revolution. Writers on attractions sometimes so use the word. (c) A fictitious force repelling every particle of the earth from the axis by an amount equal to the centrifugal force in sense (a). With this hypothesis, and supposing the earth not to rotate, the static effects are the same as in the actual case; but the dynamical effects are different. (d) As used by many high authorities, the reaction of a moving body against the force which makes it move in a curved path. In this sense it is a real force. It does not, however, act upon the moving body, but upon the deflecting body; and, far from giving the former a tendency to fly away from the center, it is but an aspect of that stress which holds it to the curved trajectory. The centrifugal force in sense (a) may be regarded as that in sense (d) transferred from the deflecting to the deflected bodies. [These differences of meaning explain the apparently conflicting views of writers.]

When I was about nine years old I was taken to hear a course of lectures, given by an itinerant lecturer in a country town, to get as much as I could of the second half of a good, sound, philosophical omniscience. . . . "You have heard what I have said of the wonderful centripetal force, by which Divine Wisdom has retained the planets in their orbits round the Sun. But, ladies and gentlemen, it must be clear to you that if there were no other force in action, this centripetal force would draw our earth and the other planets into the Sun, and universal ruin would ensue. To prevent such a catastrophe, the same wisdom has implanted a centrifugal force of the same amount, and directly opposite," &c. I had never heard of Alfonso X. of Castile, but I ventured to think that if Divine Wisdom had just let the planets alone it would come to the same thing, with equal and opposite troubles saved. *De Morgan*, Budget of Paradoxes, p. 431.

Deviating force and centrifugal force are but two different names for the same force, applied to it according as its action on the revolving body or on the guiding body is under consideration. *Rankine*, Applied Mechanics, § 538.

The student cannot be too early warned of the dangerous error into which so many have fallen, who have supposed that a mass has a tendency to fly outwards from a centre about which it is revolving, and therefore exerts a centrifugal force which requires to be balanced by a centripetal force. *Tait*, Encyc. Brit., XV, 682.

Although the earth is really revolving about its axis, so that all problems relating to the relative equilibrium of the earth itself and the bodies on its surface are really dynamical problems, we know that they may be treated statically by introducing, in addition to the attraction, that fictitious force which we call the centrifugal force. *Stokes*, On Attractions, § 1.

See the law of the conservation of energy or of force, under *energy*.—**Conservative force**, an attraction or repulsion depending upon the relative position of the pair of bodies concerned. All fundamental forces are believed to be conservative or fixed. Whatever motion takes place under the influence of conservative forces alone must take place under the same forces in precisely the reverse order, the velocities being the same, but opposite in direction. A determinate order among phenomena is therefore never due to the action of forces, but is a result of probabilities.—**Corpuscular force**, a force which, like cohesion and adhesion, acts between the molecules of a body or of different bodies; molecular force.—**Correlation of energies or of forces**. See *energy*.—**Decomposition of forces**. Same as resolution of forces.—**Deflective forces**. Non-conservative forces, forces which depend upon the velocities of the bodies between which they act. Such forces are alone capable of setting up rotations. Friction and viscosity are examples of such forces, and these are explained by physicists as the result of chance encounters, etc., among almost innumerable molecules. Among these force is the most general. *Compulsion* and *coercion* are generally more active, pushing one onward; *constraint* and *restraint* less active, the last being simply a holding back. The first three could be applied to a person's treatment of himself only by a lively figure; *constraint* and *restraint* express equally self-control and control of others. *Constraint* upon one's self is much harder than *restraint*.

There is no ground for the attempted distinction, in pronunciation and spelling, between *form*, shape, etc., and *form* (spelled *fourm* in Bailey), a bench, etc.] 1. The external shape or configuration of a body: the figure, as defined by lines and surfaces; external appearance considered independently of color or material; in an absolute use, the human figure: as, it was in the *form* of a circle; a triangular *form*; the *form* of the head or of the body; a beautiful or an ugly *form*.

Amer. Jour. Psychol., I. 626.

2. Specifically, in *crystal*, the complex of planes included under the same general symbol. Thus in the isometric system the most general form is the hexoctahedron, embracing forty-eight similar planes. In the triclinic system a form, even in the most general case, includes only two similar planes, and is called an *open form*, since it does not represent an enclosed solid or closed form; similarly, the two basal planes in the orthorhombic system constitute a form.

3. Attractive appearance; shapeliness; beauty. [Archaic.]

He hath no *form* nor comeliness. *Isa.* lvi. 2.

4j. A costume; a special dress; as, a blue silk *form*.

5. A mold, pattern, or model; something to give shape, or on or after which things are fashioned; as, a hatters' or a milliners' *form*; a *form* for jelly. — 6. In *printing*, an assemblage of types secured in a chase for stereotyping, or of other types or plates for printing. A form may consist of one page or of many pages. For stereotyping, no particular order of arrangement is necessary; for printing, the pages are arranged in such order that in folding the printed sheet they will fall in regular sequence. In book-printing, before the general use of steam-presses, two forms (see *inner* and *outer form*, below) were usually required for a sheet, one being separately printed on each side; now a single form frequently comprises a whole sheet, the paper being turned end for end for printing the second side. Large newspapers, however, still require two forms. In this sense often spelled *forme* in Great Britain.

7. In *milit. engin.*, same as *gabion-form*. See *gabion*. — 8. In general, arrangement of or relationship between the parts of anything, as distinguished from the parts themselves: opposed to *matter*, but not properly to *substance* (unless it be the intention of the writer to identify substance with matter). Thus, to say that the soul was immaterial was formerly considered the same as to say that it was a *form*. With the older writers *form* is often synonymous with *essence*, and has generally lofty associations (thus, the shape of a living being, considered as its perfection, was called its *form*, while that of a lifeless thing was called its *figure*, but not its *form*); and these ideas cling to the word in the minds of later writers, as Kant. But with many modern writers the conception is of something imposed upon the thing from without, and distinct from its life and essence. In metaphysics *form* denotes a determination, a specializing element, that constituent of a thing by virtue of which it is the kind of thing that it is. In the Platonic philosophy the *form* is the exemplar according to which a thing is made, or the mold, as it were, in which the thing is cast. In the Aristotelian philosophy *form* is the developed actuality, *matter* the undeveloped potentiality; *matter* is that element by virtue of which the thing is, *form* is that by which it is as it is — that is, the nature or essence of the thing. In Bacon's philosophy the *true form* is the physical structure or constitution of anything. In Kant's philosophy *form* is that element of an object which is imported into it by the mind; opposed to the *matter*, which is given in sense. For various other metaphysical applications of the term, see phrases below.

The figure comprehendeth the shape of things that have no life, as the faction of the elements, of trees, of fountains, of an house, a shippe, a cote, and soche like. The *fourme* containeth the portraiture of all living thinges, as the very livelye image of man, of an horse, or of a lion, as we call a man wel favoured or hardie favoured.
Sir F. Wilson, Rule of Reason (1551).

Though I shall for levity's sake retain the word *form*, yet I would be understood to mean by it, not a real substance distinct from matter, but only the matter itself of a natural body, considered with its peculiar manner of existence, which I think may not inconveniently be called either its special or denominating state, or its essential modification; or, if you would have me express it in one word, its stamp.
Bacon, Origin of Forms.

Of a beautiful landscape, melody, or poem, the blending of unity with variety appears not only in the grouping of sense-elements ("form" in the narrow meaning), but also in that of the represented content or signification of these.
J. Sully, Outlines of Psychology, p. 336.

In a phenomenon, I call that which corresponds to the sensation its matter; but that which causes the manifold matter of the phenomenon to be perceived as arranged in a certain order I call its *form*.
Kant, Critique of Pure Reason (tr. by Max Müller), p. 18.

The distinction above specified is employed by Aristotle in his exposition of the soul. The soul belongs to the category of substance or essence (not that of quantity, quality, etc.); but of the two points of view under which essence may be presented the soul ranks with *form* not with matter — with the actual, not with the potential.
Aristotle, p. 457.

Time and space are not given in sensation. They are not the sensational matter of perception, but something that makes it possible for us to represent all parts of that matter as arranged in certain relations to each other; and this we may fairly call the *form* of perception.
E. Caird, Philos. of Kant, p. 234.

9. A specific formation or arrangement; characteristic structure, constitution, or appearance; disposition of parts or conditions.

16. High condition or fitness for any undertaking, as a competition, especially a physical competition; powers of competing.

In the language of the turf, when we say that a horse is in *form*, we intend to convey to our hearers that he is in high condition and fit to run. So, again, the word is used in still another sense, for we speak of a horse's *form* when we wish to allude to his powers on the turf as compared with other well-known animals. Thus if it be supposed that two three-year-olds, carrying the same weight, would run a mile and a half, and come in a race, it is said that the *form* of one is equal to that of the other. *J. H. Walsh, The Horse*, vi.

See *concord*. — **Form of corporeity**, in *metaph.*, that in which the bodily character of a thing is determined. — **Form of form**, in *metaph.*, the idea which determines the idea is them (i. e., the one, also the nouns of Platonism).

See *ground*. — **Immaterial form**, in *metaph.*, a form the substance of which does not in itself appear. — **Informal form**. See *informal*. — **Informing form**, in *metaph.*, a form which is a part of it, and which is inherent form, in *metaph.*, a form which exists only in a thing. — **Inner form**, in *printing*, when two forms are set in type, the form which is on the pages that are to be printed is called the *form*, and the form which is on the pages that are to be printed by the folds of both in an in-

sheet. This form is usually printed first. — **Intelligible form**, in *metaph.*, a form which can be perceived only by the intellect. — **Outer form**, in *printing*, when two forms are required, the form which contains the first and last pages of a signature, as 1 and 8 in a sheet of octavo, or 1 and 16 in a sheet of folio, and the pages which therefore appear on the outside of the folded sheet. Usually this side of the sheet is printed last. — **Principal form**, in *metaph.*, a form which itself constitutes a species; opposed to a *disponent* or *disposing form*, which merely prepares the matter for the reception of the principal form. — **Ribbed form**, in *hand paper-making*, a square or oblong wooden frame with parallel brass wires steadied by cross-wires, used for making lined paper. — **Sensible form**, in *metaph.*, a form which can be perceived by the senses. — **Separate form**, in *metaph.*, a form which, while it may be capable of existing only in matter, yet has a being apart from the matter. — **Simple form**, in *metaph.*, mere form, without matter: thus, God is held to be *simple form*. — **Substantial or essential form**, in *metaph.*, that in which the essence of a thing consists. The substantial form has four marks: it does not directly affect the senses; it has no variations of degree (though this was disputed); it is good and perfect; it is the principle or origin of the properties and operations of that to which it pertains. Much use was made by the medieval logicians of the doctrine of *substantial forms*, and thus the absurdity of trying to explain the properties and operations of things by means of mere abstract statements was put in a strong light, which the conflict with the real explanations of science soon heightened. Thus, if the Newtonian law of gravitation were merely a transformation of Kepler's laws, and implied nothing further, it would be of the nature of a substantial form; but in point of fact it predicts the various lunar equations, the planetary perturbations, the precession of the equinoxes, the tides, and the figure of the earth. — **Theory of forms**, the theory of the changes of algebraic forms due to linear transformations of their variables; especially, the theory of invariants, reciprocals, etc. — **To take form**, to assume a definite shape, appearance, or order; become definite and clear; as, the conception gradually took form in his mind. — **Syn. 1.** Shape, Fashion, etc. See *figure*, n. — **13.** Rite, Observance, etc. See *ceremony*.

rioid passerine birds, having long slender feet, the outer toe united at the base to the middle toe, full plumage on the rump, and a characteristic coloration; the South American ant-birds. The family is divisible into *Thaumophilus* (ant-shrikes), *Formicivora* (ant-wrens), and *Formicariidae* (ant-thrushes). Under various names, the *Formicariidae* have been included with several different groups of birds with which they have little affinity, as the *Laniidae*, *Paridae*, etc.; and the terms *Formicariidae* and *Formicariinae* have usually included a number of heterogeneous forms now eliminated. The family as here limited is confined to the warmer parts of America and is highly characteristic of the Neotropical fauna. Also *Formicariidae*.

They have a thrush-like bill, large stout feet, a very short square tail, sexes usually alike in color, and terrestrial habits. These ant-birds are confined to the warmer parts of America; the genera and species are numerous.

In the human brain it consists of two longitudinal bundles of fibers, one on each side, which rise from the corpora albicantia, pass up, as the anterior pillars of the fornix, in front of the fornix of Momo and behind the anterior commissure, then, somewhat flattened and in apposition to each other, arch backward beneath the corpus callosum and above the velum interpositum, forming the body of the fornix, and then diverge toward the back part of the corpus callosum, to turn down, as the posterior pillars of the fornix (crura fornices), into the floor of the descending cornua of the lateral ventricles, where their free edges form the fimbriae. There is a peculiarity about the structure of the optic lobes, which has given rise to much diversity of interpretation of the parts of the brain in osseous fishes. The posterior wall of these lobes, where it passes into the cerebellum, or in the region which nearly answers to the valve of sinuons in mammals, is thrown forward into a deep fold which lies above the crura cerebri and divides the forca tertia and quartum ventriculum from the ventricle of the optic lobes throughout almost the whole extent of the latter. This is the *fornix* of Gottsche.

=Syn. 3. *Forsake*, *Desert*, *Abandon*, *Relinquish*, *Quit*. These all express the idea of giving up or leaving. The first three are strong expressions, ordinarily conveying the idea of loss to that which is left; the fourth, on the other hand, suggests loss to him who *relinquishes*. *Forsake* is chiefly applied to leaving that by which natural affection or a sense of duty should or might have led us to remain; as, to *forsake* one's home, friends, country, or cause; a bird *forsakes* its nest. In the passive it often means left desolate, forlorn. *Forsake* may be used in a good sense; as, the color *forsook* her cheeks; even hope *forsook* him. *Desert* may be synonymous with *forsake*, but in the active voice it usually implies a greater degree of culpability, and often the infringement of a legal obligation; as, to *desert* one's family, regiment, ship, colors, post. Such was the original use of the word. *Abandon* most fully expresses complete and final severance of connection; as, to *abandon* a ship or a hopeless undertaking; to *abandon* hope or property. Sometimes, but not so often as *desert* or *forsake*, it implies the dropping of all care or concern for an object; as, to *abandon* one's offspring. *Relinquish* is not used with a personal object; as, to *relinquish* a claim, land, effort. (See lists under *relinquish* and *abandon*.) To *quit* is to leave finally or hastily, or both.

Fossil remains of Men or implements of human manufacture have hitherto been found only in late Tertiary . . . deposits, and in caves, mingled with the remains of animals which lived during the glacial epoch.

Huxley, *Anat. Vert.*, p. 422.

Spiders are not creatures which belong solely to the present geologic era of the earth, for *fossil* spiders . . . as well as spiders in amber have been found; the oldest in the coal formation. *Encyc. Brit.*, II. 299.

3. Figuratively, antiquated; superannuated; outgrown; belonging to a past epoch or discarded system: as, a *fossil* statesman; *fossil* manners or literature.—*Fossil* bezoar, button-mold, copal, etc. See the nouns.—*Fossil* charcoal. Same as *mother-of-pearl* (which see, under *coal*).—*Fossil* cork, flax, paper, and wood, popular names for ashes respectively of cork-like, flax-like, or paper-like texture, or resembling fossilized wood.—*Fossil* farina. It is of good quality, and sufficient in quantity to be an important article of trade.—*Fossil* screw, a popular name for a cast in rock left by a spiral shell. *E. D.*

II. *n.* 1. Any rock or mineral, or any mineral substance, whether of an organic or of an inorganic nature, dug out of the ground.—

2. Specifically, in later geological and mineralogical use, anything which has been buried beneath the surface of the earth by natural causes or geological agencies, and which bears in its form or chemical composition the evidence that it is of organic origin. Thus, the shell of a mollusk may be preserved unchanged, in both form and chemical composition; or, while retaining its original form, it may have been converted into silica; or it may have disappeared entirely, leaving only a cast as evidence of its former existence; or there may remain only a mold of its interior, formed after the soft parts had entirely decayed: in any of these cases, the specimen or fragment of rock which thus shows by its form that it, either wholly or in part, belonged to an organic body, or that its configuration resulted from the presence of something having had an organized existence, would be properly called a *fossil*. Even the rocks showing traces of trails, footprints, bored cavities, or other evidences of contact with organic life, are usually designated as *fossils*. The bones or other remains of species now living on the earth, if buried by any recent catastrophe, such as a flood or landslide, would not, as a general rule, be designated as *fossil*, but would be called *recent*. If, however, such an entombment took place in prehistoric times, the term *fossil* would by most geologists be used in describing the occurrence in preference to *recent*.

3. Hence, figuratively, one who or something which is antiquated, or has fallen behind the progress of ideas; a person or thing of superannuated or discarded character or quality: as, a curious literary *fossil*.—*Dyestone fossil*. Same as *dyestone ore*. See *dyestone*.

When the intensity of the magnetic field surrounding a mass of metal or other conductor is by any means increased or diminished, Foucault currents are generated in the conductor. Uniform motion of translation in a uniform magnetic field does not produce such currents. Rotatory motion of the conductor in a uniform magnetic field does produce them. Their energy is expended in heating the mass or in arresting the motion to which they are due.

—**Hero's fountain**, a pneumatic apparatus in which the elastic force of a confined body of air, increased by hydraulic pressure and reacting upon the surface of water in a closed reservoir, produces a jet which may rise above that surface to a height equal to the effective height of the pressing column: named from Hero of Alexandria, to whom the invention of the instrument is ascribed. It consists essentially of an open basin, and two closed reservoirs at different levels below the basin. A tube connects the upper parts of both the reservoirs. Another tube connects the bottom of the basin with the lower part of the lower reservoir. A detachable tube with a jet-nozzle at its upper end passes through the center of the basin and down into and very nearly to the bottom of the higher reservoir. The detachable tube being removed, the higher reservoir is partly filled with water through the opening; then the tube is replaced, and water poured into the basin. This water, running down into the lower reservoir, forces the air from the latter up into and increases the pressure in the higher reservoir, displacing the water therein and forcing it through the detachable tube in the form of a jet. This ejected water falls into the basin and thence passes to the lower reservoir, and thus the action continues till nearly all the water in the higher reservoir has been discharged through the jet.—**Steam-fountain**, a fountain in which the liquid is raised by the pressure of steam upon the surface in a reservoir.—**Syn.** 1 and 2. *Spring*, etc. See *well*.

Fourierism (fōr'i-ēr-izm), *n.* [*Fourier* (see *def.*) + *-ism*.] The communistic system propounded by the French socialist Charles Fourier (1772-1837), based on his philosophy of the passions and affections. Several phalanxes were established in France and the United States; but it was not found practicable to carry out his plans fully in any of them, and their existence was brief. Also called *associationism*.

The most skillfully combined, and with the greatest foresight of objections, of all the forms of socialism, is that commonly known as *Fourierism*.

(The related animals of South America are thoood, not alopecoid, and are known as *fox-wolves*, of the genera *Lycalopex* and *Pseudalopex*.) The fennecs are small African foxes, closely allied to *Vulpes* proper, but commonly placed in a different genus, *Fennecus*. (See cut under *fennec*.) Resembling these externally, but structurally different, is the African fox, *Megalotis* or *Otocyon blanfordi*, a generalized form representing a different subfamily *Megalotinae*. The tail of the fox is called the *brush*. In the English Bible the word *fox* refers in some places to the jackal, in others to the fox. See *reputed*.

4. In *math.*: (*a*) In *arith.*, a part, or a number of aliquot parts, of unity. Unity is regarded as divided into equal parts, and one or more of these parts as taken to constitute the fraction. The number of parts into which the unit is divided is termed the *denominator*, and the number of these parts taken the *numerator*. The denominator is commonly written below, and the numerator above, a horizontal or diagonal line; thus, $\frac{3}{4}$.

Fractions written in this form are called *common* or *vulgar fractions*. (See *decimal*.) A *proper fraction* is one whose numerator is less than its denominator; an *improper fraction*, one whose numerator is greater than its denominator; as, $\frac{5}{3}$, $\frac{7}{4}$. A *simple fraction* expresses the ratio between two whole numbers; as, $\frac{2}{3}$; a *compound* or *complex fraction* expresses the ratio between fractions (or mixed numbers), or between a fraction (or mixed number) and a whole number; as,

$$\frac{\frac{1}{2}}{\frac{3}{4}}, \frac{93}{4}, \frac{23}{4} + \frac{1}{2}, \frac{5}{7}$$

Compound or complex fractions can always be reduced to simple fractions. A *compound fraction* is also defined as a fraction of a fraction. A fraction is said to be reduced to its lowest terms when the numerator and denominator contain no common factor.

The *fraction* which denotes the ratio of the map to the true area is sometimes termed the *representative fraction*.

free-thinker (frē'thing'kēr), *n.* One who is not guided in the formation of his beliefs by obedience to authority, but submits the claims of authority to reason as the ultimate arbiter. The early application of the term was to those who occupied a rationalist position in regard to current religious beliefs and dogmas; hence it acquired the still current sense of skeptic, infidel, and even atheist. The word, though employed earlier, is generally supposed to have been brought into common use in 1713 by the publication of Anthony Collins's "A Discourse of Freethinking, occasioned by the Rise and Growth of a Sect called *Free-thinkers*." Although this work declares *free-thinking* as the endeavor to judge a proposition according to the weight of evidence, and does not explicitly maintain any proposition which can offend a Protestant, it was rightly judged to be a covert attack upon fundamental tenets of the Christian religion. The *free-thinkers* specifically so called formed a class of deistic writers in England in the seventeenth and eighteenth centuries, the chief of whom were Toland (died 1722), Anthony Collins (1676-1720), Woodson (1689-1733), Tindal (died 1733), and Bolingbroke (1678-1751). See *deist*.

The idiot is supposed to say in his heart what David's fool did some thousands of years ago, and was therefore designed as a proper representative of those among us who are called atheists and infidels by others, and *free-thinkers* by themselves. *Atchison*, *Religions in Waxwork*.

Is he a churchman? then he's fond of power;
A quaker? say; a proselytizer? say;
A smart *free-thinker*? all things in an hour.

Pope, *Moral Essays*, I. 157.

The *freethinker* perhaps too has imbibed his principles from the persons among whom he was bred up.

J. Tucker, *Light of Nature*, V. viii.

Who born within the last forty years has read a word of Collins and Toland and Tindal and that whole race who called themselves *free-thinkers*?
Lurke, *Rev. in France*.

If Collins included as *freethinkers* all who differed from the prevalent creed of the time, Bentley would not deny that *freethinkers* had done good service. It is on the other hand, Collins meant, as Bentley assumed him to insinuate, that all these *freethinkers* were atheists, then he was palpably wrong.

Leslie Stephen, *Eng. Thought*, IV. § 14.

free-thinking (frē'thing-king), *n.* The act or habit of inquiring freely into the truth of a fact or point of faith in which authority requires implicit belief; especially applied to skeptical inquiry into the supernatural elements of Christianity.

freezing-mixture (frē'zing-miks'tūr), *n.* A mixture that has the property of producing a sufficient degree of cold—that is, a sufficiently rapid absorption of heat—to freeze liquids. In general, such a mixture consists of a solid and a liquid in which the solid rapidly dissolves; for example, hydrochloric acid and sodium sulphate. Its effect is due to the fact that the change of a solid to a liquid requires a certain amount of heat (see *latent heat*, under *heat*), and if this change goes on rapidly, a considerable lowering of temperature results. In the common case of pounded ice and salt, which gives a temperature of about 0° F. (-18° C.), there is a double change, both resulting in the absorption of heat—the melting of the ice and the solution of the salt. See *ice-machine*.

freezing-point (frē'zing-point), *n.* The temperature at which a liquid freezes; loosely, the temperature at which ice melts. The *freezing-point*, in the strict sense, depends on many circumstances difficult to control, and many liquids, including water, can with care be cooled several degrees below their melting points without freezing. The melting point of ice (water), however, is relatively fixed and readily observed. Consequently, the melting point is always substituted for the freezing-point in making thermometers, although it is generally called by the latter name.

The *freezing-point* of water and the melting point of ice, as Professor Tyndall remarks, touch each other as it were.

II. n. 1. The language spoken by the people of France. French is parallel with Provençal, Spanish, Portuguese, Italian, Wallachian, and minor dialects, called together the *Romanic languages*, being descended from the Latin as spoken by the Romans and the peoples of the various provinces whom they brought under their dominion, mingled with the Celtic and Teutonic tongues with which Latin was thus brought in contact. (See *Romanic*.) *French* means "the language of the Franks," a Teutonic people merged with the mixed races of Gaul, who received the Frankish name (the country being thence called *Francia*), but retained their Romanic speech, the Franks and other Teutonic tribes, and later the Normans, accepting the speech of the people they conquered. It is divided chronologically into *Old French* and *Modern French*, the former extending from the ninth century to the fourteenth, or, with the convenient inclusion (as usually in this dictionary) of what is specifically called *Middle French*, to the sixteenth century. Old French existed in many dialects, the phrase, indeed, when unqualified or indiscriminated, including the aggregate of such dialects. The most important were the dialect of the Ile de France, which, as the "French of Paris," has become the modern literary French; and that of Normandy, the *Norman* or *Norman French*, which, transferred to England at the Conquest and there developed (as Anglo-French), gave much to and took much from the English, and was finally displaced by the mixed English speech thus formed. (See *English*.) By later borrowing from French, or from the Latin on the French model, the Romanic part of the English vocabulary is now to a great extent nearly identical with that of French. As the most central and highly developed of the Romance dialects, French began, in the sixteenth and seventeenth centuries, to take the place of Latin as the general language of diplomacy, polite society, and commerce. Its importance in this respect has much diminished in the present century. It is now drawn upon by other languages chiefly for terms of line art, dress, and cooking. The use of accents as a customary part of French orthography began in the seventeenth century; they now form a rigid artificial system, often a guide to pronunciation, and reflecting generally, but with numerous exceptions, previous etymological conditions of the words concerned. Regarded as a Romance language, French is remarkable for its departure from the Latin type. In its vowel and consonant system (notably in its nasal vowels), its sweeping contractions, and its general destruction of final sounds or syllables, with the retention in many cases of these lost sounds in spelling, it differs markedly from other Romance tongues.

With *fret* of AS. origin is now thoroughly confused in form and sense another verb of diff. origin, namely, < OF. *fretter*, another form of *frater*, F. *frotter* = Pr. *fretar* = It. *frattare*, rub, chafe, fray, fret, < L. as if **fricare*, freq. of *fricare*, pp. *frictus*, rub: see *friction*, and cf. *frot*, *frate*.]

2. In *mech.*, the resistance to the relative motion, sliding or rolling, of surfaces of bodies in contact: called in the former case *sliding*, in the latter *rolling friction*. It is partly due to the adhesion of bodies, but the greater part of it is the result of their roughness. The friction proper is independent of the velocity and of the area of contact; it depends solely upon the nature of the two surfaces and upon the pressure upon them, to which it is directly proportional. What is sometimes called the *static friction* of fluids is *viscosity* (which see). The friction of a fluid upon a solid is *resistance*; it is now recognized as an important factor in the designing of ships.

Alien friend, a foreigner whose country is at peace with one's own.—**Friends of God**, a name assumed by an organized brotherhood of German mystics existing in the fourteenth century, who, in opposition to the formalism and ecclesiasticism of their age, emphasized the possibility and duty of complete self-renunciation and intimate spiritual union with God. Prominent among the leaders were Nicholas of Basel and John Tauler. As they were not bound together by either an ecclesiastical organization or a common creed, their views of religious truth differed, and some of their utterances gave rise to charges of pantheism and antinomianism. **Friends of Light, Protestant Friends**. See *Free Congregations*, under *congregation*.—**Next friend** (Law *Ex. processum amicus or amicus*), in law: (a) In some jurisdictions, a person by whom an infant or a married woman sues, and who is responsible for costs; (b) In *Scotland*, a tutor or curator. **Progressive Friends**, a religious society first formed in 1835 in Pennsylvania, rationalistic in its theological tendencies, but distinguishing the binding obligation of creeds and the exercise of disciplinary authority. **Society of Friends**, the proper designation of a Christian sect commonly called Quakers, which took its rise in England about the middle of the seventeenth century through the preaching of George Fox. A division occurred in portions of the society in America in 1827, through the preaching of Elias Hicks, whose followers, commonly called *Hicksites*, held doctrinal views closely approximating those of the Unitarians, while in church government and other respects they retain the

images of the orthodox Friends. The latter agree doctrinally with other evangelic Christians, but lay greater stress on the doctrine of the personal presence and guidance of the Holy Spirit. They have no pastoral ministry, and accept the ordinance of baptism and the Lord's Supper in a spiritual sense only, rejecting their outward observance as church rites. They condemn all oath-taking and all war. The organization of the Society involves four periodical gatherings called 'meetings': namely, preparative meeting, monthly meeting, quarterly meeting, and yearly meeting. The body called the Yearly Meeting has supreme legislative power. There are two Yearly Meetings in Great Britain, one in Canada, and ten in the United States. Fringilla (frin-jil'ä), *n.* [NL., < L. *fringilla*, also *gringilla* and *fringilla*, some small bird, supposed to be the chaffinch; origin unknown; possibly, like *finch*, *q. v.*, ult. imitative of the bird's note.] A Linnean genus of birds, the finches, once nearly continuous with the modern family *Fringillidae*, and of no determinate limits; now usually restricted to such species as the chaffinch or common finch of Europe, *F. caelebs*, and considered typical of the family *Fringillidae*. It is not susceptible of exact definition, and is of fluctuating limits. The group has been made to include the larks (*Laniidae*), which are scutellipantlar; the weaver-birds (*Ploceidae*), which are io-primaried; and to exclude the buntings (*Emberizidae*), which cannot be distinguished from the finches. The tanagers (*Tanagridae*) have been both included and excluded. According to the present composition of the group, the buntings are included, the other birds above mentioned being excluded; and the *Fringillidae* contain all the finches, buntings, grosbeaks, crossbills, sparrows, linnets, siskins, etc., which conform to the characters above given. There are some 600 nominal species, distributed in upward of 100 so-called genera. No tenable subdivision of the family exists, though several have been proposed. The latest authority makes 3 subfamilies: *Coccothraustinae*, *Fringillinae*, and *Emberizinae*, or the grosbeaks, finches proper, and buntings.

Dan. *frø*, *a* frog; Lecl. *frøder*, *a* frog; the origin is unknown.] *A* batrachian of the family *Ranidae* (which see), as the common British *Rana temporaria*, or its North American representative, *R. sylvatica*. Of the true frogs there are about 250 species, belonging to 15 genera, common in most parts of the world except the Neotropical and Austrogean regions, including for the most part aquatic or arboreal batrachians, distinguished by their ability and symmetry, as well as by their webbed toes, from the related batrachians which are popularly named *toads*; but the distinction is not always preserved. Of the genus *Rana* alone there are upward of 110 species, most of which are aquatic, are expert swimmers, and capable of making very long leaps; some are terrestrial, and some arboreal. Several different kinds of frogs are edible, as the common European *R. esculenta*, *R. catesbeiana*. (See *bullfrog*, and cuts under *Anura* and *Rana*.) Others of the same country are *R. palustris*, *R. holarctica*, and *R. clamata*. The toes of some arboreal frogs are enormously lengthened and fully webbed, enabling the creatures to make long flying leaps. (See *treefrog*, *Rhacophorus*.) Some have the ends of the toes dilated, like many of the toads. The tongue of most true frogs is emarginate behind, with a process on each side. Most frogs deposit their spawn in masses in the water, and the young hatch from the egg as tadpoles, provided with a tail and external gills, which disappear with the growth of the permanent limbs. The arboreal batrachians known indifferently as *treefrogs* or *tree-toads* are not frogs in any proper sense, but belong to a different suborder (*Archeogastrea*) of salient amphibians. (See *Hylidae*.) The name *frog* is loosely applied, with or without a qualifying term, to some other batrachians equally remote from the *Rana* form, and locally in the United States to certain lizards. See phrases below.

By this arrangement the steam from the fresh fruit rises to the trays above, keeping the fruit bathed in steaming vapor. fugue (fö-g), *n.* [*F.*, *< It. fuga*, also *fugna*, a flight, a fugue; *< L. fuga*, a flight, *< fugere*, flee; see *fugitive*.] In music, a polyphonic composition based upon one, two, or even more themes, which are enunciated by the several voices or parts in turn, subjected to various kinds of contrapuntal treatment, and gradually built up into a complex form having somewhat distinct divisions or stages of development and a marked climax at the end. The most general divisions of a fugue are the exposition, the development, and the conclusion. A *strict fugue* is one in which each division is developed symmetrically and in a purely contrapuntal manner; while a *free fugue* is one that is irregular or incomplete in plan or detail. (a) In the *exposition*, the first voice enunciates the thematic subject, six, antecedent in the tonic key; the second voice then enunciates it (answers, *comes*), consequent in the dominant key, sometimes with slight alterations; the third voice then imitates the first at the octave usually; the fourth voice imitates the second in the same way; and so on, until all the voices, if there are more than four, have entered with the theme. The earlier voices usually accompany the later ones as they enter; and the melody added by the first voice to the answer in the second is often contrived in double counterpoint with it, so as to serve throughout the fugue as a counter-subject or foil for the original theme. The character of the theme gives the name to the fugue; a *double fugue* having a diatonic subject, a *chromatic fugue* a chromatic subject, a *Bach fugue* a subject in the Bach mode, etc.; the character of the subject generally determines the character of the development. A *real fugue* is one in which the answer imitates the subject, note for note, usually at the fifth or fourth, while a *tonal fugue* is one in which the answer contains such slight alterations of the subject as shall add just exactly to its different tonality. A *triple fugue*, *secco* is one whose answer is the inversion of the subject; so *fugue began in major, a fugue began in minor*, etc. The order in which the voices shall enter and the exact relations of the answer to the subject are both regulated by rules. A *double fugue* has two subjects, a *triple fugue* three subjects, etc. A *fugue in two parts* is one for two voices only, etc. A free part is sometimes added to those essential to the contrapuntal development of the fugue. (b) In the *development*, the subjects, answers, and counter-subjects are used repeatedly, either wholly or in part, in different keys, under varying treatment, so as to unfold their entire contrapuntal capacity. The successive sections should have an increasing contrapuntal interest and intricacy, and should be closely bound together; though episodes or diversions from the orderly treatment of the principal themes may be inserted between the sections for contrast. (c) In the *conclusion*, the theme is

usually presented by all the voices in turn, as in the exposition, but frequently so rapidly that the entries overlap. Such an overlapping section is called the *stretto*. In connection with this, and usually as the final section, a pedal point is often introduced. The fugue is the consummate form of the polyphonic style of composition, requiring for its successful production a mastery of all the devices of counterpoint, as well as a very high grade of inventive and constructive genius. The greatest writers of fugues are J. S. Bach (1685-1750) and G. F. Handel (1685-1759).

They are remarkable for the prolongation of the forehead into an empty vesicular expansion, and are so named because it has been asserted that the lantern-fly proper (*F. lanternaria*), a native of China, emits a strong light from this inflated projection. The evidence of this luminosity, however, is more than doubtful. A Chinese species has, on equally equivocal testimony, been called *F. candebens*. See *lantern fly*.

The common fulmar is *Fulmarus glacialis*, a bird as large as a common sea Lull, and greatly resembling a herring-gull in coloration, being white with a pearl-blue mantle and black tips on the primaries, but distinguished by the long tubular nostrils, which lie high upon the ridge of the

upper mandible. It inhabits the northern seas in prodigious numbers, breeding in Iceland, Greenland, Spitzbergen, the Shetland and Orkney Islands, the Hebrides, etc. It feeds on fish, the blubber of whales, and any fat, putrid, floating substance that comes in its way. It makes its nest on sea cliffs, and lays only one egg. The natives of the island of St. Kilda, in the Hebrides, value the eggs above those of any other bird, and search for them by the most perilous descent of precipices by means of ropes. The fulmar is also valued for its feathers, its down, and the oil found in its stomach, which is one of the principal products of St. Kilda. When caught or assailed, it lightens itself by discharging the oil from its stomach. There are several closely related species or varieties in the North Pacific. The slender-billed fulmar is *Fulmarus tenuirostris* or *Thalassoma glaciale*, widely dispersed over the seas. The giant fulmar, *Ossifraga grisea*, also called *bone-breaker*, is a sooty-brown or fuliginous species, as large as a small albatross.

The normal operations of each of these faculties are called its *functions*. The term is taken from the action of the bodily organs. From these it is transferred to organs in the metaphysical sense, as the 'organs of government,' and the *functions* which they perform. 6. In *math.*, a mathematical quantity whose value depends upon the values of other quantities, called the arguments or independent variables of the function; a mathematical quantity whose changes of value depend on those of other quantities called its variables. Thus, if the diameter of a circle be conceived to vary in length, the length of the circumference will also vary with it, in accordance with a fixed geometrical law, and is therefore a function of the diameter, the latter being regarded as the independent variable. So in the equation $y = ax + b$, if x be conceived to vary independently, y will be its function, since its value will vary with each successive value of x . The common algebraic notation is $y = f(x)$, to be read ' y is a function of x .' F , ϕ , and other letters are often used in place of f . It is not the special value of $f(x)$, but this quantity considered as variable and as depending upon x , which is called the *function*. It is even called the same function irrespective of the special values of certain parameters upon which it may depend and which are considered not as variables, but as constants. The earlier analysts used *function* to mean merely a power, or continued product of a quantity into itself. The present mathematical meaning first appears in the Latin correspondence between Leibnitz and John Bernoulli. Mathematical usage is not precisely settled as to the meaning, and this in two respects. First as some writers use the word, the possible values of the function depend upon the values of the variables, so that if u is a function of x , there must be some value which u can take for some value of x , which it cannot take for some other value of x . But other writers hold that two quantities which are functions of a third are functions of each other. For example, if $x = \tan t$ and $u = \tan (t/2)$, so that $x = \tan t$, they hold that u is a function of x , although it can take every value for every value of x , for there is even here a connection between the values of x and u , so that in the course of any continuous change of x the mode of change of u is somewhat restricted. Secondly, according to the usage of Cauchy and his followers, if an imaginary quantity, $X = Yi$, be so connected with another, $x = u$, that Y and Y are each of them functions of x and u , say $Y = P(x, y)$ and $Y = Q(x, y)$, then the former imaginary is a function of the other; but the majority of mathematicians have restricted the name *function* to what the school of Cauchy would term numerical and determinate functions, although such a restriction is impossible where the variable does not vary continuously. The tendency of recent writers is to give the greatest possible breadth to the application of the term.

It is active when the bulk of it is invested in the subjects of the business or enterprise, as merchandise, ships, factories, land, bank loans, etc.; passive when it is invested in such a way (as in real estate or stocks) as to produce a fixed or nearly uniform income, which alone is used for the specific purpose, or when it is used or drawn upon directly for expenses, being insufficient to produce the requisite income by investment, or when it is maintained by collections or contributions for specific objects, as the support of missionaries or of charitable enterprises. Both active and passive funds may be either individual or collective; when collective, an individual interest in the former usually consists of a partnership or the ownership of joint stock, and in the latter of membership or of some right of joint control, unless the contributions are absolute gifts.

2. To convert (a floating debt) into capital or stock, or into a more or less permanent debt, represented by bonds for definite sums, bearing interest at a fixed rate, and commonly redeemable within a fixed period of years. That part of the indebtedness of a government or corporation which is payable immediately or soon, so that early provision for payment must be made or forbearance obtained, is called the *floating debt*. To fund such an indebtedness is to cancel it by inducing the creditor to take in its place obligations having considerable time to run, and issued, in convenient portions or shares, in the form of interest-bearing bonds or certificates available to the holder as marketable securities; or by procuring a fresh loan on the issue of such obligations, and using the proceeds to pay off the floating indebtedness. To refund a debt is to repeat this process when the time obtained by the funding expires. The *fund* of a body politic or corporate is the aggregate of the debt thus provided for. It is approximately the same in amount as the old debt, unless it is increased, as is often the case, by including in it the expenses of funding, or by issuing the obligations below par. The funded debts of governments are spoken of as the *public funds*, and the securities issued are spoken of as *stocks* or *bonds*. Such securities, when issued by corporations, are usually spoken of in the United States as *bonds* (the word *stocks* being applied to shares, which do not represent the debt of a corporation, but ownership in it), and in Great Britain as *bonds* or *debentures*. With the funding of a debt is frequently coupled the creation of a sinking-fund for its redemption. See *sinking-fund*, under *fund*, *n.*

prongs of the furcula commonly meet at an approximately acute angle, like a V, and thence develop a process called the *hypoleptina*; the extremities pass to each shoulder-joint. Sometimes the prongs meet at an open angle, like a U, and they may be ankylized with the keel of the sternum. The furcula serves to keep the shoulders apart, and is strongest, with most open time, in birds of the greatest powers of flight. It is occasionally rudimentary or defective, the clavicles being separate and very small, as occurs especially in some flightless birds. stadium), prop. the length of a furrow, or the drive of the plow before it is turned, *< furlh*, a furrow, + *lang*, long. The length of a furrow would ordinarily be equiv. to the length of the field; like other orig. indefinite terms of measure, the word came to have a definite value, being fixed by custom at 40 rods, and hence called in M.L. (AL.) *quarcentena*: see *quarantiac*.] A measure of length equal to the eighth part of a mile, 40 rods, poles, or perches, 220 yards, or 201.17 meters. The furlong corresponds to the Roman stadium, and one eighth of any kind of mile is called a furlong in older writers. Thus, English writers of the sixteenth century often call 625 feet a furlong; and the reason is that 5 feet was taken to be a pace, so that a Roman mile of 1,000 paces would be 8 × 625 feet. So the eighth part of a Scotch mile, or nearly 742 feet, was a furlong. In the English translation of the New Testament *furlong* is used to translate the Greek *stadion*, stadium. Abbreviated *fur*.

An holden a knyghtes court and a comite with the reyne.

furlough (fēr'lō), *n.* [The spelling *furlow* occurs in the 18th century, but *furlough* appears to be the earliest spelling (as in Blount's Gloss., ed. 1674). As the spelling *furlough* does not follow that of the orig. language, it was prob. intended to be phonetic (from a military point of view), the *gh* perhaps as *f* and the accent on the second syllable: *< D. verlof*, leave, furlough, = LG. *verlof* = G. dial. *verlob* (these prob. of Scand. origin), *< Dan. forlor*, leave, permission, furlough, leave of absence, = Sw. *förlof*, leave, pardon; a form (with prefix *for-*, *för-* = E. *for-*) equiv. to the older Dan. *orlof*, leave of absence, furlough, = Sw. *orlof*, dismissal, discharge, = Icel. *orlof*, leave, = D. *oorlof*, leave, = OHG. Leave of absence; especially, in military use, leave or license given by a commanding officer to an officer or a soldier to be absent from service for a certain time. In the United States army the term is used officially only for such leave given to an enlisted man, the same permission granted to a commissioned officer being designated a *leave of absence*. A soldier availing himself of the permission is said to be *furloughed*, or *on furlough*; an officer, *on leave*. The word is also used to designate the temporary discharge from service of a civilian in the employ of the government. In the United States navy it has a special significance, indicating the condition of an officer of duty either for fault or at his own request and only receiving one half of "waiting-orders pay."

[cap.] In classical myth., one of the avenging deities, called in Greek mythology the Erinyes or, by euphemism, Eumenides, and by the Romans the Furia or Dirae, daughters of Earth or of Night, represented as fearful maidens, often winged, and with serpents twined in their hair, clad in dusky garments girdled with red. They dwelt in the depth of Tartarus, and with their power of avenging wrong, whether intentional or not, were feared by gods and men. According to fully developed Greek tradition, they were three in number and called Tisiphone, Alecto and Megara. They relentlessly punished crime, especially breaches of piety and hospitality, both before and after death. They were therefore also regarded as goddesses of fate, in common with the Fates; hence the use of the name in the extract from *Meville*.

fuse (fūz), *n.* [Abbr. of *fuser*.] A tube, casing, ribbon, etc., of various materials, filled or saturated with a combustible compound, and used as an exploder for firing a blast or for igniting any exploding charge, as of a military shell. A common fuse consists of a rope-like tube filled with some slow burning composition, as niter, sulphur, and meal powder, its common use being to allow the one who ignites it time to get to a place of safety before the explosion. An *electric fuse* consists of the explosive substance so arranged as to be fired either by a spark of high potential electricity formed at a break in an electric circuit (the so-called *tescoia tube*), or by the incandescence of a fine (for example, platinum) wire which forms part of the circuit through which the current is passed (the so-called *quantity fuse*). By extension, devices performing the same function as the common fuse, as mechanical and chemical exploders of all kinds, are termed *fuses*. The fuses used for exploding projectiles are of four kinds, *time*, *percussion*, *concretion*, and *combination*. In the first class the time of burning is regulated by cutting the ribbon, composition filled tube, etc., to the required length; the second is ignited by the impact of the projectile against an object, the third is operated by the shock of the charge;

while the combination-fuses combine the principles of the other classes with more or less complexity. See *blasting-fuse*. Also spelled *fuz*.—**Abel fuse**, an electric fuse invented by Abel, the explosive material of which is composed of subsulphid and sulphosulphid of copper with potassium chlorate. It is fired by a spark.—**Percussion-fuse**, a fuse prepared for action by the shock of the discharge, and put in action on striking the object. *Hammersly*.—**Quantity-fuse**, an electric fuse in which the conducting circuit is completed by a short piece of some substance, usually a metal, of tolerably high resistance, which is raised to a high temperature, practically to incandescence, on the passage of a current of sufficient strength.—**Safety-fuse**, a slow-burning ribbon or tape for exploding a blast.—**Tension-fuse**, an electric fuse in which the conducting circuit is not complete, the firing being accomplished by the passage of a spark.—**Wooden fuse**, a hollow plug of wood filled with fuse-composition firmly driven in, the open end being protected from moisture by a water-proof cap, used for exploding military shells. For service, a part of the plug is cut off, according to the length of time it is desired that the composition shall burn, and the plug is then driven into the hole in the shell.

2. A cone or solid conical piece in a watch or a spring-clock on which is wound a chain or cord, attached at one end to its widest part and at the other to the barrel containing the mainspring, the action of which unwinds it, transferring it to the barrel. The object of the fusee is to equalize the effect of the mainspring, as its force is relaxed through regular diminution of tension, by gradually diminishing the resistance of the chain or cord through its increasing distance from the axis of the fusee. This axis is the arbor of the main wheel, which is attached to the fusee and imparts the motion derived from the spring to the other wheels. In many watches the fusee is now dispensed with, its object being attained by other contrivances. The term is also applied to similar mechanical contrivances used for other purposes. Also called *fuse-wheel*.

The one national army (in the time of Ælfred) was the *fyrd*, a force which had already received in the Karolingian legislation the name of "landwehr," by which the German knows it still. The *fyrd* was, in fact, composed of the whole mass of free land-owners who formed the folk; and to the last it could only be summoned by the voice of the folk-moot.

G 1. The seventh letter and fifth consonant in the English alphabet. It is a sign of Italian origin, having been fabricated by the Romans by a slight modification of C, when the distinction of the (hard) *g* sound from the *k*-sound, both until then represented alike by *c*, was found admissible and was effected. (See C.) *G* has in English two principal or normal sounds, usually called "hard *g*" and "soft *g*" respectively. The former is the value originally belonging to the sign. The "hard" *g*-sound is the sonant (or voiced, or intoned) correlative of the *k*-sound, made by a close contact between the upper surface of the back part of the tongue and the adjacent palate, while breath enough to set the vocal chords vibrating is, during the continuance of the contact, forced up into the pharynx—the breach of this contact, as in the case of the other so-called mutes (or stops, or checks), giving the alphabetic element. The *k*- and *g*-sounds are most often called the guttural mutes; although (since the guttural proper has nothing to do with their formation) many authorities prefer to call them *palatal*, or *back-palatal*. The "soft" sound of *g* in English is compound (= *j* = *dzh*), the sonant correlative of the *ch*-sound (see *ch*); it is, like the soft *c*-sound in relation to hard *c*, a product of the alteration of the hard *g*, the point of contact being shifted forward on the tongue, and a spirant or sibilant vanish being added to the mute element. It belongs mainly to the Romance part of the language. It never occurs at the beginning of words of Anglo-Saxon origin (where *g* is always hard or has changed to *y*); and but rarely at the end of such words (before "silent" *e*, as in *hinge*, *singe*, *swinge*). Except in such instances, *g*, in words of Germanic origin, is hard also before *e* and *i*. The principal digraphs containing *g* are *gh* and *ng*. The former is written instead of the earlier guttural spirant *h* (as *night* for earlier *nicht*), and is either silent (as in *right*) or pronounced as *f* (as in *rough*). With the digraph *ng* is written the nasal which corresponds to *g* and *k* in the same manner as *n* to *d* and *t*, or *m* to *b* and *p*, and which (for example, in *singing*) is just as much a simple sound as *n* or *m*. This guttural or palatal nasal is not an independent alphabetic element in any such way as is *n* or *m*; in the older stages of the languages of our family, it appears only before a next following *g* or *k*, as a nasal made guttural by assimilation to them; and the combination *ng* representing it is simply one in which the *g*, formerly pronounced, has become silent, like the *b* of *ab* in *lamb*, *climb*, *tomb*, etc. *G* is now silent before *n* in the same syllable, as in *guave*, *sign*. For *y* as the original of consonant *g*, see *y*.

On no account perhaps is it [the "Ballad of King Arthur"] more remarkable than the fact of its close imitation of the famous *gabs* made by Charlemagne and his companions at the court of King Hugon, which are first met with in a romance of the twelfth century. . . . It is to be presumed that the author of the ballad borrowed from the printed work, substituting Arthur for Charlemagne, Guyenne for Oliver, Tristram for Roland, etc., and embellishing his story by converting King Hugon's spy into a "lolly leend," by whose agency the *gabs* are accomplished.

It. *gal'era*, a galley, and F. *gal'ice*, *gal'iot*.] 1. A sea-going vessel propelled by oars, or using both oars and sails. The earliest ships of all nations were of this class, and were at first confined chiefly to coasting or to the navigation of narrow seas. The war-galley of the Greeks originally had a single mast carrying one square sail amidships, and later two masts, but depended primarily upon its oars, ranged in a single line on each side, and each handled by one rower. It was rated according to the whole number of these. The principal sizes were the *trireme*, of thirty oars, and the *penteconter*, of fifty. Ships of this form continued to be used as vessels of burden, but were early superseded for war by galleys rated according to the number of banks of oars or ranks of rowers, as the *bireme* (a two-banked vessel), *trireme*, *quadrireme*, etc. Greater numbers of banks are mentioned, up to forty banks of oars in a vessel of enormous size built for Ptolemy Philopator of Egypt. How these numerous banks of oars were arranged is not definitely known; it is probable that not more than three could have been placed one above another. The first recorded Roman fleet consisted wholly of triremes, and this was always the most common armament. The ancient naval vessels were long, sharp, and narrow in model, like a modern steamer, were capable of great speed, and carried large crews. Full decks, or several decks, were in time substituted for the primitive half-deck, or the short decks at the stem and stern; and rams, towers, and other means of offense and defense were added. *Galleys* continued in use in the Mediterranean and other seas till late in the seventeenth century, ordinary ones in later times having from five to twenty-five oars on a side in a single row, each oar worked by several men, with two or three masts and triangular sails; and indeed they may be considered as not yet entirely obsolete, being represented by the feluccas and boats of similar model on the Mediterranean and neighboring seas. Larger vessels were called *gal'leas*. (See *gal'leas*.) The labor of rowing was from an early date assigned to mercenaries, and afterward to slaves and prisoners of war; and in some countries, especially France, nearly all criminals were condemned to service on the galleys of the state, and were hence called *galley-slaves*. See *trireme*.

The *Gallican* theory [of church government] views the Church as a constitutional monarchy, of which the Pope is either Jure Divino, or merely Jure Ecclesiastico, the responsible head; invested with legislative and executive functions while the supreme representative power of the Church, the Ecumenical Council, is in abeyance; but owing implicit obedience to such a synod when assembled, liable to be suspended or deposed by it and compelled to submit to its decisions on pain of the guilt and the consequences of schism. *J. M. Neale, Eastern Church, i. 15.*

Gallican Church, the branch of the Roman Catholic Church in France, which has enjoyed greater privileges and had a more independent development than the branches

of that church in other European countries. Its comparative independence has been due to the persistent resistance of the civil power, supported by a portion of the clergy and people distinctively called the Gallican party, to the encroachments of the papal power; but there has always been a strong ultramontane party in the French church favorable to papal claims.—**Gallican liberties**, the peculiar privileges enjoyed by the Gallican Church. In general they consisted of greater freedom from papal domination over the actions of the bishops and of the king than was customary in other Roman Catholic countries, or than is customary in France at the present time. These liberties were especially defined by the pragmatic sanction of Louis IX. in 1259, by the pragmatic sanction of Charles VII. in 1453, and by the "Declaration of the Clergy" drawn up by Bossuet in 1682, which asserted the right of the king to intervene in church matters without papal interference. The Gallican liberties were confirmed under the rule of Napoleon I., but the French church secretly still uses in Gaul or France and in some adjacent countries, especially in Spain. In Gaul these liturgies were suppressed by Charlemagne and his successors in the ninth century, and the Roman office was substituted for them. The remains of these rites are few and fragmentary. The wording of some of the prayers in the different local uses differed greatly, but the important features and the arrangement of parts were the same throughout. The liturgies originally used in Spain were of the same class, so that the group has been called the Hispano-Gallican family of liturgies. In Spain these rites had by the eleventh century become almost entirely supplanted by the Roman, but at the beginning of the sixteenth century the typical Spanish form, known as the *Mozarabic liturgy*, was revived by Cardinal Ximenes. The ancient liturgies of the British, Irish, and Scotch apparently belonged to the Gallican group; but their classification is disputed, and the remains are scanty. The use established among the Anglo-Saxons by St. Augustine of Canterbury probably contained Gallican elements, of which there are traces in the use of sursum, etc. The Gallican type of liturgy is believed to be derived through the primitive churches of Arles and Lyons from Ephesus, and has accordingly been called *Ephesian*, and referred to St. Paul and St. John. It differs greatly from the Roman in its constituent parts, their names, and arrangement, and agrees in many and important particulars with eastern liturgies. The nomenclature of its various parts is, however, almost entirely peculiar to itself, and it is distinguished by the fact that most of these parts, retaining their titles and places in the office, are variable, the number of different occasions for which such variations are provided being also much greater than in other western rites, and this variation extending even to the canon. See *Mozarabic*.

II. n. In Rom. Cath. theol., one who holds Gallican doctrines. See *Gallicanism*.

Gallicanism (gal'i-kan-izm), *n.* [*< Gallican + -ism.*] The spirit of nationalism within the French church, as opposed to the absolutism of the papal see. It grew in strength during the middle ages, and culminated in the reign of Louis XIV. The Gallican liberties, in which this spirit was expressed, disappeared at the time of the revolution; and, though since restored and nominally in existence, ultramontanism has during the nineteenth century triumphed over Gallicanism.

gallon (gal'on), *n.* [< ME. *galon*, *galun*, *galoun*, < OF. *galon*, *galun*, *galun*, *galun*, *jalon*, *jallon*, *jaillon*, F. *gallon* (= Sp. *galon* = Pg. *galão* = It. *gallone*; ML. *galo(n)-s*, *galana*, a gallon; perhaps ang. of OF. **gale*, *jale*, F. *jale*, a bowl. Cf. *gall*⁴.] 1. An English measure of capacity for dry or liquid substances, but usually for liquids, containing 4 quarts. The old wine-gallon, which was declared by law to contain 231 cubic inches, and to be equal to a cylinder 7 inches in diameter and 6 inches high, is now the legal gallon of the United States, where it is taken as the volume of 8.339 pounds avoirdupois of water at its maximum density weighed in air at 30 inches and 62° F. The imperial gallon now established in Great Britain for all liquid and dry substances contains 10 imperial pounds of distilled water at 62° F., weighed in air of the same temperature and at 30 inches. It has been ascertained to contain 277.274 cubic inches. A statute of 1266 declares that "8 pounds do make a gallon of wine, and 8 gallons of wine do make a bushel." There was thus but one legal gallon. The pound referred to in the statute was somewhat lighter than the troy pound, but it would seem that in course of time the avoirdupois pound was substituted in practice, for the wine-gallon universally used in the latter part of the seventeenth century contained 224 cubic inches, while 8 avoirdupois pounds of British wine (of gooseberry or elderberry) measure about 226 inches. This wine-gallon was generally supposed, and in 1689 was legally declared, to contain 231 cubic inches, so that it was found convenient in 1707 to legalize a standard that was more accurately of this capacity. This law remains in force in the United States though that standard has long been disused. A statute of 1422 defined the gallon as 8 troy pounds of wheat (still recognizing but one gallon), but the standard exchange gallon constructed under Henry VII., and supposed to represent the gallon then used, contains 274 cubic inches. It was generally thought to contain 272 cubic inches, and the statute of 1697, defining dry measures, was intended to conform to this, although it actually makes the corn-gallon 268.6 cubic inches. Elizabeth constructed a standard gallon of 2-2 cubic inches (or nearly 8 pounds avoirdupois of wheat), which became the old ale-gallon. The Irish gallon which from 1450 to 1650 had contained 8 pounds troy of wine, was at the latter date carried to 272 cubic inches; but in 1735 it was again changed to 217.1 cubic inches for all purposes. The Scotch gallon was no less than 840 cubic inches. The United States gallon is equivalent to 3.7853 liters. Abbreviated *gal*.

galvanomagnetic (gal'va-nö-mag-net'ik), *a.* Same as *electromagnetic*.

galvanometer (gal'va-nöm'e-tär), *n.* [< *galvanic* + Gr. *μέτρον*, a measure.] An instrument for detecting the existence and determining the strength and direction of an electric current. In all galvanometers the principle of action is the same. It depends upon the force which Oersted discovered to be exerted between a magnetic needle and a wire carrying a current—a force which tends to set the needle at right angles to the direction of the current, and whose intensity, other things remaining the same, depends directly upon the strength of the current.

The term *galvanometer* is applied to an instrument for measuring the strength of electric currents by means of the deflection of a magnetic needle round which the current is caused to flow through a coil of wire.

S. P. Thompson, Elect. and Mag.

Apertodic galvanometer, a dead-beat or thoroughly damped galvanometer.—**Astatic galvanometer**, an instrument which consists of a pair of similar needles magnetized, with their poles turned opposite ways, and still connected at their centers, so that both will swing together.

Astatic Galvanometer.

The one tends always to turn in a direction opposite to the other under the earth's magnetic attraction, so that if the needles were perfectly alike they would form a perfectly astatic pair, or a pair that would not tend to assume any particular direction from the magnetic influence of the earth. One of the needles, *ab*, is nearly in the center of the coil, CDEF, through which the current passes; the other, *a'b'*, just above the coil. When a current traverses the coil in the direction of the arrows, the action of all parts of the current upon the lower needle tends to urge the astatic pole *a* toward the back of the figure and the boreal pole *b* to the front, while the upper needle, *a'b'*, is affected principally by the current CD of the coil, which urges the astatic pole *a'* to the front of the figure and the boreal pole *b'* to the back. Both needles are thus urged to rotate in the same direction by the cur-

rent, and, as the opposing action of the earth is greatly enfeebled by the combination, a much larger deflection is obtained than would be given by one of the needles if employed alone. Galvanometers are also made astatic by the use of a fixed magnet so placed as to counteract the influence of the earth's magnetism.—**Ballistic galvanometer**, an instrument used to measure the strength of a current which acts for only a very short time, as that produced by the discharge of a condenser. It involves the use of a heavy needle, which takes a relatively long time to swing. The sine of half the angle of the first swing is proportional to the quantity of electricity which has flowed through the coil.—**Dead-beat galvanometer**, a galvanometer in which the needle is so damped, by induction or otherwise, that on the passage of a current it will move to its final deflection without oscillation.—**Differential galvanometer**, a form of galvanometer in which the coil consists of two separate wires wound side by side, and used to compare two currents. If the currents are sent in opposite directions through these wires the motion of the needle will be determined by the difference in their intensity; if they were equal the needle would remain stationary.—**Sine galvanometer**, a magnetic needle poised at the center of a coil of insulated copper wire wound round a vertical circle that may be turned horizontally on its stand. In use the needle and vertical circle are at first both in the magnetic meridian. When a current passes, the needle is deflected, and the vertical coil is turned by the observer until its plane coincides with the magnetic axis of the needle. The strength of the current is as the sine of the angular deviation.

Any sensitive galvanometer in which the needle is directed by the earth's magnetism can be used as a *sine galvanometer*, provided the frame on which the coils are wound is capable of being turned round a central axis.

S. P. Thompson, Elect. and Mag., p. 167.

Tangent galvanometer, a very short magnetic needle delicately suspended so as to turn in a horizontal plane. The point about which it turns is at the center of a vertical coil of copper wire through which the current is passed. The diameter of the coil is at least ten or twelve times the length of the needle. The needle is therefore usually not more than half an inch long; and, for convenience of reading its deflections, long light pointers of aluminium or of glass fiber are cemented to its ends. In use the instrument is placed so that the vertical coil of copper wire is in the plane of the magnetic meridian. The current is then sent through the coil, and the angle by which the needle is deflected is read off. The strength of the current then is proportional to the tangent of the angle of deflection, whence the name of the instrument.—**Thomson's mirror galvanometer**, the most sensitive galvanometer yet invented. Its needle, which is very short, is rigidly attached to a small, light, concave mirror, and suspended in the center of a vertical coil of very small diameter by a silk fiber. A movable magnet is provided for bringing the needle into the plane of the coil when the latter does not coincide with the magnetic meridian, and also for rendering the needle more or less astatic. Needle, mirror, and magnet weigh only about 1½ grains. At a distance of two or three feet from the mirror is a solid wooden stand, with a graduated scale, facing the mirror. In the stand, just under the center of the scale, a hole is cut, and a fine wire is stretched upright across it. A strong lamp stands behind the opening, so that its light will fall on the mirror and be reflected back on the scale. An image of the wire will thus be constantly thrown on the scale, and the slightest motion of the needle and its mirror will produce a much greater motion of this image. As the current flows the one way or the other the index will move to one side or the other. This galvanometer was devised for use in connection with the Atlantic submarine cables. It was long the only instrument with which signals could be read through long submarine lines; and it is still employed to a great extent, though now superseded by the siphon-recorder of the same inventor.

Elfvig found that when a root is placed vertically between two electrodes it curves towards the positive electrode—that is, against the direction of the current. In one case (cabbage) the curvature was towards the negative electrode. Muller (Hettingen), in repeating Elfvig's experiments, found that the curvature was in all cases such as to tend to place the long axis of the root in the plane of the current, the curvature being towards the negative pole. These phenomena are spoken of as "galvanotropism." *Engel, Bot., XIX, 60.*

The gamboze of commerce is mainly derived from *G. Hanburyi*, a handsome laurel-like tree of Siam, Cambodia, and Cochinchina. (See *cut* under *Garcinia*.) It is of a rich brownish-orange color, becoming brilliant yellow when powdered, forming a yellow emulsion with water, and having a disagreeable acid taste. It is a drastic purgative, but is seldom used in medicine except in combination. It is mostly used as a pigment in water-color painting, producing transparent yellows, verging on brown in deep masses. It is quite durable as a water-color, and fairly so in oil. Ceylon gamboze is obtained from *G. Morella*. False gamboze is a similar but inferior product of *G. Xanthochyana*. The so-called American gamboze is the juice of *Platanus Guianensis* and other species of South America. In doses of a dram or even less gamboze has produced death.

The pipe *gamboze* of Siam, so called because it is preserved in the hollows of bamboos, is considered the best which comes into the London markets, and commands the highest price.

The *games* of classical antiquity were chiefly public trials of athletic skill and endurance, as in throwing the discus, wrestling, boxing, leaping, running, horse- and chariot-racing, etc. They were exhibited either periodically, usually in honor of some god, as the Olympic, Pythian, Nemean, and Isthmian games of Greece, the Ludi Apollinares at Rome, etc., or from time to time for the amusement of the people, as the Circusian games at Rome. The prizes in the Greek periodical games were generally without intrinsic value, as garlands or wreaths of olive- or laurel-leaves, of parsley, etc.; but at the Panathenaic games of Athens the prizes were quantities of olive-oil from the consecrated orchards, given in a special type of painted amphora, of which a hundred or more might constitute a single prize. The four great Greek national games formed the strongest bond in the nature of a national union between the various independent Greek states. At them any person of Hellenic blood had the right to contest for the victory, the most highly esteemed honor in Greece; and citizens of all states, however hostile, met at these games in peace.

ganglion (gang'gli-on), *n.*; pl. *ganglions, ganglia* (-ōnz, -jē). [*< LL. ganglion, a tumor, < Gr. γαγγλίον, a tumor under the skin, on or near a tendon*.] 1. An enlargement in the course of a nerve, containing or consisting of a collection of ganglion-cells; any assembly of ganglion-cells. The nervous system of invertebrates generally, and the sympathetic nervous system of vertebrates, consists essentially of a chain or series of ganglia connected by commissures, giving off filaments in various directions, forming plexuses or networks around principal viscera, blood-vessels, and other important organs. Some of the larger sympathetic ganglia are also called *plexuses*; thus, the semilunar ganglia of the abdomen form the solar plexus. In the cerebrospinal nervous system of vertebrates, ganglia regularly occur on the posterior or sensory roots of the spinal nerves. There are likewise ganglia upon some of the motor or sensorimotor cranial nerves, as the vagus, fifth, and facial. All the masses of gray neurine in the brain are also ganglia, as the optic thalami, corpora quadrigemina, corpora striata, etc.; even the general mass of cortical gray matter, both of the cerebrum and of the cerebellum, constitutes a great ganglion. The principal ganglia have special names. See the phrases below.

ganglion-cell (gang'gli-on-sel), *n.* In *anat.*, a nerve-cell which has a well-marked nucleus and nucleolus, and sends off one or more processes, usually branching, which connect physiologically with other similar processes of cells, or, in some cases, constitute peripheral nerve-fibers. In addition to the function which belongs to nerve-fibers of receiving and transmitting nervous impulses, ganglion-cells may have the function of distributing, increasing, diminishing, and in some cases apparently of initiating such impulses, as well as of being a trophic center for nerve-fibers connected with them. Such cells are abundant in the gray matter of the brain and spinal cord, in the ganglia of the dorsal roots of spinal nerves, and in the ganglia of the sympathetic system, and they may exist as scattered cells or form plexuses, as those of Auerbach and Meissner. Besides these unipolar, bipolar, and multipolar cells, cells without processes have been described as ganglion-cells, and called *apolar*. They are regarded by some as having lost their processes in the course of anatomical and microscopic manipulation, and by others as being embryonic forms. Ganglion-cells, with the nerve-fibers and certain terminal structures, make up the essential parts of the nervous system. See *cut* under *retina*.

The members who occupy seats on the other side of the passage are said to *sit below the gangway*, a position which does not imply separation on similarly strict party lines.

Ganister is also artificially made by mixing ground quartz and fire-clay; this artificial form is used for lining Bessemer converters. Calcined, pulverized, and sifted ganister is used on a straight buff-stick of bull-neck leather to smooth the threaded shoulders of socket-knives after they have been filed.—**Ganister beds**, a series of beds in the northern counties of England, immediately over the millstone-grit, belonging to the lower coal-measures; they produce excellent flagstones. One seam of coal in England is called the *ganister coal*, because it almost always has a ganister floor. Hence the name *ganister beds* has been given to the lower coal-measures.

It is about 3 feet long and 6 feet in stretch of wings, and of a white color tinged with amber-yellow on the head, with black primaries.

Gannet (*Sula bassana*), adult and young.

It inhabits the Atlantic coasts of Europe and North America, feeds on fish, which it catches by pouncing down upon them from on high, and congregates in vast numbers to breed in certain rocky places on the sea-coast. It is a strong flier, but is not found far from land. Some of the principal breeding places are the Hebrides, St. Kilda, Ailsa Craig, and the Bass Rock, on the European coast, and the "Gannet Rock," in the gulf of St. Lawrence. The flesh is rank, but the young are sometimes eaten, and the old birds are taken in numbers for their feathers.

The genera *Archegosaurus* and *Dendrocton* are alluded by Owen as examples of this order.

Owen has distinguished the oldest forms of labyrinthodonts with armoured skull as *Ganocephala*.

ganoidean (ga-noi'dē-an), *a. and n.* Same as *ganoid*.

Ganoidei (ga-noi'dē-i), *n. pl.* [NL., pl. of *ganoides*; see *ganoid*.] 1. In Agassiz's system of classification, one of four orders into which the class of fishes was divided. It contained those which have ganoid scales or plates of an angular, rhomboidal, polygonal, or subcircular form, as distinguished from those with placoid, cycloid, or ctenoid scales. As thus framed by Agassiz, the ganoids were an artificial group, including silurids, plectognaths, lophobranchs, and other teleost fishes. By Owen the *Ganoidei* were divided into two suborders, *Lepidoganoidei* and *Placoganoidei*. By later authors the group has been restricted and raised to the rank of a subclass.

Hence—2. In Müller's system, a subclass of fishes with muscular or multivalvular aortic bulb, free branchiæ, covered gill-cavity, and no optic chiasm, a spiral intestinal valve (sometimes rudimentary), and usually fulera on one or more fins. It was divided by Müller into two orders: *Chondrostei*, with a cartilaginous skeleton, as the sturgeons and paddle-fishes, and *Holosteï*, with bony skeleton, as the *Polypteridei*, *Lepidosteïde*, *Amblostei*, and many extinct forms. Each one of the existing families of ganoids has been made the type of an order by late writers. Thus, the sturgeons (*Acipenseridae*) typify the order *Chondrostei* in a restricted sense, or *Glanoistomi*; the paddle-fishes (*Polyodontidae* or *Spatulariidae*), the order *Selachostomi*; the hichirs (*Polypteridae*), the order *Crossopterygii* or *Actinistia*; the bony pikes or gars (*Lepidosteidae*), the order *Rhomboganoidei* or *Ginglypodi*; and the bowfins (*Amblostei*), the order *Cycloporoidei* or *Halecomorphi*. Besides these there are three extinct orders, *Acanthodini*, *Placodermi*, and *Pseudonanti*. The ganoids abounded in former geologic periods, as far back as the Silurian; but the few above named are the only extant types. See *ganoid*, *n.* Also *Ganoidea*.

A military punishment formerly inflicted for heinous offenses, in which the offender, stripped to his waist, was compelled to run a certain number of times through a lane formed by two rows of men standing face to face, each of them armed with a switch or other weapon with which he struck the offender as he passed; also, such a punishment used on board of ships, and, by extension, any similar punishment (used by some savage tribes and in Russia). Among the North American Indians this was a favorite mode of torturing prisoners of war, who often died under it. The Indians struck their victims with clubs, knives, lances, or any other convenient weapon.

tuted by Edward III. some time between 1344 and 1350, the uncertainty arising from the early loss of all its original records. Its purpose has been supposed to have been at first only temporary. gas (gas), *n.* [A word invented by the Belgian chemist Van Helmont (died 1644), who expressly says "Hunc spiritum, incognitum haecenus, novo nomine *gas* voco" (this vapor, hitherto unknown, I call by a new name, *gas*). The word came into general use: D. G. Dan. Sw. *gas*, F. *gaz*, Sp. It. *gas*, Russ. *gas*, Hind. *gās*, etc. Various guesses have been made at the word which might possibly have suggested the particular syllable *gas*, as D. *gaest* (AS. *gäst*, E. *ghost*), spirit; G. *gäsch*, froth, foam; Sw. *gäsa*, ferment, effervesce; F. *gaze*, gaze, etc.] 1.

A substance possessing perfect molecular mobility and the property of indefinite expansion. The term was originally synonymous with *air*, but was afterward applied to substances supposed (but wrongly—see below) to be incapable of reduction to a liquid or solid state. In accordance with this use *gas* was defined to be a permanently elastic fluid or air differing from common air. According to the kinetic theory of gases, now accepted, the molecules of a gas are in a state of rapid motion in right lines, constantly colliding with one another and with the walls of any containing vessel, and hence exerting pressure against them. For example, in the case of air at ordinary temperatures it is calculated that the average velocity of the molecules is about that of a rifle-bullet as it leaves the gun. If a gas is compressed into less volume, the number of impacts against the sides of the containing vessel is in-

creased, and hence the pressure or tension increases, and conversely (Boyle's law). The temperature, according to this theory, is the average kinetic energy of a molecule, hence, increased temperature brings increased momentum, and so increased pressure on the walls of the vessel. This theory also explains many of the phenomena of viscosity, diffusion, etc. By increased pressure and diminished temperature (at least below the critical point) any gas can be reduced to the liquid form, the amount of pressure and degree of cold required differing widely with different gases. The so-called *fixed* or *permanent* gases, which were long supposed to be incompressible, as hydrogen, oxygen, nitrogen, etc., yield only to extreme conditions of cold and pressure. There is no essential difference between a *gas* and a *vapor* (see *vapor*), but for convenience the latter name is given to the gaseous form of substances which under the ordinary conditions of temperature and pressure are liquids or solids. Vapors and the gases most easily liquefied deviate most widely from Boyle's law, that the volume is inversely proportional to the pressure, and also from the law of the constant increment of expansion with increase of temperature. Gases are distinguished from liquids by the name of *elastic fluids*, because of their power of indefinite expansion. (See *liquid*.) The number of gaseous bodies is great, and they differ greatly in their chemical properties. They are all, however, susceptible of combining chemically with fluid and solid substances. Some of them are of great importance in the arts and manufactures, as, for example, carbonic acid or carbon dioxide, sulphurous acid or sulphur dioxide, and coal-gas. Gases are ordinarily invisible.

That such subterranean steams will easily mingle with liquids, and imbue them with their own qualities, may be inferred from the experiment of mixing the *gas* (as the Helmontians call it), or the scarce coagulable fumes of kindled and extinguished brimstone, with wine, which is thereby long preserved.

Boyle, *Origin and Virtues of Gases*, ii.

Gases are distinguished from other forms of matter, not only by their power of indefinite expansion so as to fill any vessel, however large, and by the great effect which heat has in dilating them, but by the uniformity and simplicity of the laws which regulate their changes.

Clerk Maxwell, *Heat*, p. 31.

Specifically—2. In *coal-mining*, any explosive mixture of fire-damp with common air.—3. In popular language, a compound of various gases, used for illuminating and heating purposes. It is some form of carburated hydrogen artificially made and distributed by pipes to points of consumption. The common kind is *coal-gas*, obtained from bituminous coals by carbonization in retorts at a high temperature. A carburated hydrogen gas, called *water-gas*, resulting from the passing of steam through a mass of incandescent carbon and the subsequent admixture of hydrocarbons or other enriching substances, is also used. *Gil-gas* is an illuminating gas obtained by the distilling at high temperature of petroleum or other liquid hydrocarbons.

4. A gas-light: as, the *gas* is dim; turn down the *gas*. [Colloq.]—5. Empty or idle talk; frothy speech; rant. [Colloq.]

'Tis odd that our people should have not water on the brain, but a little *gas* there. Emerson.

— **Gas-liquor**, liquor separated by condensers from crude coal-gas in the process of manufacture. It contains in solution a number of ammonium compounds which would diminish the illuminating power of the gas, and from which ammonium sulphate and chloride are manufactured.

— **Natural gas**, combustible gas formed naturally in the earth. It is sometimes found issuing through crevices, but is generally obtained by boring. Natural gas has long been used in western China and elsewhere. It has been found in great abundance in western Pennsylvania and the adjoining region of New York, as also to a limited extent in Ohio, Indiana, and West Virginia. It was first utilized in New York in 1821, and began about 1874 to be of importance commercially, especially in the vicinity of Pittsburgh. The area over which natural gas and petroleum are obtained in quantity, and the conditions of their occurrence, are in most respects essentially the same, but the principal source of the gas in Ohio and Indiana is a formation lower down in the geological series than that furnishing it in Pennsylvania. In the former States the gas comes from the Trenton limestone, a group belonging to the Lower Silurian; in the latter, from the Devonian. The natural gas burned at Pittsburgh contains about 67 per cent. of marsh-gas, 22 of hydrogen, 5 of an ethylene compound, 3 of nitrogen, together with a small percentage of carbonic acid, carbonic oxid, olefiant gas, and oxygen. — **Rock-gas.** Same as *natural gas*.

The resulting flames assume the fanciful forms of beaks, bats, wings, fish tails, cockspurs, etc., whence the different forms of burners have received distinctive names. The material used to tip or form the tops of the burners has also given names to them, as the lava tip burner. See *burner*. The wet meter is composed of an enter box about three fifths filled with water. Within this is a revolving four-chambered drum, each chamber being capable of containing a definite quantity of gas, which is admitted through a pipe in the center of the meter, and, owing to the arrangement of the partitions of the chambers, causes the drum to maintain a constant revolution. This sets in motion a train of wheels carrying the hands over the dials which mark the quantity of gas passing. The dry meter consists of two or three chambers, each divided by a flexible partition or diaphragm, by the motion of which the capacity on one side is diminished, while that on the other is increased. By means of slide valves, like those of a steam-engine, worked by the movement of the diaphragms, the gas to be measured passes alternately in and out of each space. The contractions and expansions set in motion the clockwork which marks the rate of consumption. The diaphragms in all the chambers are so connected that they move in concert.

A reservoir or storehouse for gas, especially for the ordinary illuminating gas produced in gas-works, which supplies the various pipes employed in lighting streets and houses. The main part of the structure is a cylindrical gas-holder, formed of riveted sheet iron plates braced internally, closed at the

upper end, and resting at the open lower end in a masonry or brickwork water-tank of corresponding form, in which it rises or falls according to the amount of gas passing into or out of it. The holder (often more than 100 feet in diameter, and sometimes made in telescoping sections) is suspended from a heavy framework by chains passing over pulleys and terminating in partially counterbalancing weights, which aid in regulating the pressure. The name *gas-holder* is often used for the whole structure, as more appropriate than *gasometer*, since it is not in any sense a meter.

[The form *gastropod* is more commonly used.] **Gastropoda, Gastropoda** (gas-te-rof'ō-dā, gas-trop'ō-dā), *n. pl.* [NL. (Cuvier, 1798), neut. pl. of *gasteropus, gastropus* (-pōd-); see *gasteropodous*.] A group of mollusks to which different values and limits have been assigned. (1) Originally it was considered by some as a section and by others as an order of the mollusks, which were then ranked as a class. Later it was raised to a class and almost universally accepted as such. (2) It has generally been customary to include in it all the mollusks with a distinct head and foot developed from the abdominal surface, thus contrasted with the classes *Cephalopoda* and *Pteropoda*. (3) By many it has been extended to include all having a head, thus embracing the *Pteropoda* and excluding only the *Cephalopoda*. (4) By others it has been restricted to those having a distinct head, abdominal foot, and a spiral, subspiral, or low oval or conic shell or naked body, thus excluding the *Scaphopoda*. (5) By others still it has been further confined to those having a spiral or subspiral shell or naked body, and a more or less asymmetrical arrangement of the internal organs, the *Chitonida* and some naked related types being consequently eliminated. Within even the narrowest limits assigned to it, the class is very diversified. Generally a univalve shell is developed, but in many forms of several orders or suborders the shell is obsolete or entirely absent in the adult. Even in the naked forms, however, the embryo or larva is generally provided with a shell. The shell is usually spiral, or rather of an elongated cone form wound round in a spiral coil, but varying from a very high turreted form to a discoid or even sunken spire, an intermediate stage being the most common, in various types it is of a broad cone or pedestal-form shape, and in others, especially the terrestrial slugs, it is reduced to a scale-like element concealed under the mantle. The shape of the shell generally agrees with the structure of the soft parts, but sometimes differs so much that a gastropod can only be properly classified by examination of the anatomy of the animal. In most marine species, as well as in many terrestrial ones, an operculum more or less closing the aperture of the shell is developed from the foot of the animal; but in most of the land shells (*Pulmonata*) it is wanting, one of the distinguishing characteristics of *Gastropoda*, giving name to the class, is the foot, which is generally broad, muscular, and disk-like, and attached to the ventral surface, but in some it is obsolete, and in others, as the heteropods, compressed and adapted for swimming. The gastropod shell may be regarded as a typical gastropod. The class comprises also whelks, periwinkles, limpets, cowries, and many other univalve or shell-less forms. No known gastropod has a bivalve shell. *Cochleata* is a synonym. (6) In Lamarck's system of classification (1822-1829), a suborder of order of *Cephalopoda* (*Gastropoda*) and Cuvier, containing those gastropods in which the shell is reduced or wanting, thus including the nudibranchs, limpet-form *Pulmonata*, and similar forms collectively contrasted with *Pteropoda*.

Snakes seldom have on the belly many small scales like those of the back and sides, being usually furnished instead with short, wide, transverse gastrosteges which reach from side to side, and are imbricated, the hind edge of one overlapping the fore edge of the next succeeding. By muscular action when the snake is wriggling the whole series of gastrosteges stand somewhat on edge, so that their sharp hind borders catch on the slightest inequality of the surface, over which the snake thus slides as if pushed along by numberless little feet. That such is the action of the gastrosteges may be inferred from the ineffectual writhing of a snake when placed on a perfectly smooth surface, as a plate of glass. The last gastrostegae, technically called the *preanal* or *postabdominal*, is usually blind, or otherwise modified. Scutes somewhat like gastrosteges cover the under side of the tail, and are known as *urosteges*. See *urostegae*.

Gastrovascular system, in *Acalepha*. See the extract.

The principal digestive cavity [of *Acalepha*] seldom remains single, but grows out into secondary cavities, which have the character of pouches, or of canals. . . . These accessory spaces of the digestive cavity, included with the latter under the designation *gastrovascular system*, undertake the function of a circulatory system, without being morphologically anything else than the differentiations of a primitive enteric cavity.

gastrula (gas'trō-lā), *n.*; *pl.* *gastrulae* (-lē). [*NL.* dim. of *L.* *gaster*, < *Gr.* *γαστήρ*, belly, stomach; see *gaster*.] In *embryol.*, that form of the germ of the *Metazoa* which is a germ-cup of which the walls consist of two layers.

Gastrula of a Chalk sponge (*Olynthus*).

A, external view. *B*, longitudinal section through the axis; *g*, primitive intestine (primitive intestinal cavity); *o*, blastopore or primitive mouth (primitive mouth opening); *z*, inner cell-layer of the body-wall, the upper germ-layer, hypoblast, ectoderm, or intestinal layer; *z'*, outer cell-layer (the outer germ-layer, epiblast, ectoderm, or skin-layer). (From Haeckel's "Evolution of Man.")

It is the result of that process of invagination which occurs in most animals, whereby a vesicular morula, blastosphere, or blastula is converted into a cup-like two-layered germ, with a blastopore or orifice of invagination, and an endoderm or membrane inclosing a primitive intestinal cavity, the endoderm itself being inclosed within an ectoderm. The word enters into many loose compounds of obvious meaning, as *gastrula body*, *cup form*, *formation*, *organ*, *mouth*, *shape*, *stomach*, etc., mostly derived from the translation of the German compounds used in Haeckel's works. See *gastrulation*.

The stage of embryonic development in which the cellular wall consists of two layers of cells is called by Haeckel the "*gastrula* stage." L. F. Ward, Dynam. Sociol., I, 359.

The *gastrula* seems to me the most important and significant germ-form of the animal kingdom.

(No nutritive yolk in these eggs; none advanced enough to show any mesoblastic cells or mesoderm.) In all, some letters mark same parts: *c*, the egg, ovum, cytula, or parent-cell; *f*, cleavage-cells, blastomeres, or segmentella; *m*, multiberry-germ or morula; *b*, vesicular germ or blastula; *g*, germ-cup or gastrula; *s*, cleavage-cavity, blastocoele, or hollow of blastulation; *d*, primitive intestinal cavity, archenteron, or hollow of gastrulation; *e*, primitive mouth, archæostoma, or blastopore. Total but unequal egg-cleavage of an amphibian (frog), resulting in a modified or hood gastrula. 7, cytula (amphicytula); 8, cleavage stage of 4 cells; 9, morula (amphimorula) already in process of blastulation; 10, blastula (amphiblastula) completed; 11, gastrula (amphigastrula), still showing traces of blastular stage. Figs. 12-17. Total but unequal egg-cleavage of a mammal (woman), resulting in another modified amphigastrula or hood gastrula. 12, cytula; 13, cleavage stage of 4 cells; 14, same, of 4 cells; 15, morula beginning to undergo gastrulation without actual blastulation; 16, gastrulation further advanced (theoretically corresponding to the blastulae of figs. 4, 5, and 10); 17, gastrulation completed (and to be followed, not preceded as in the other cases, by blastulation, or the formation of a blastodermic vesicle). (From Haeckel's "Evolution of Man.")

A glove; specifically, in medieval armor, a glove of defense, either attached to the defensive armor of the arm or separate from it.

Throughout the twelfth and thirteenth centuries the sleeve of the hauberk was long, and closed at the end covering the hands in the form of mittens; a glove of leather was worn beneath the mail to protect the hand from the chafing of the metal rings. Toward the end of the thirteenth century a slit was made at the palm, through which the hand could be passed, allowing the mail mitten to hang from the wrist. A few instances of mail gauntlets with separated fingers appear in English monuments of the same period. In the fourteenth century the separate armed glove appears, consisting at first of leather upon which roundels and other plates of steel are sewed; and about 1350 is found the completely articulated glove of hammered steel, each finger separate and each joint free to bend. The changes after this are merely in the direction of greater delicacy of execution, allowing still freer movement. In tournaments and jousts the left hand was sometimes guarded by a heavy steel glove without joints. See *main-defer*. Also called *glove-of-mail*.

A, Gauntlet of plate, early 14th century. B, Gauntlet of plate, later 14th century. C, Gauntlet of mail forming part of the hauberk, 14th century. From Viollet-le-Duc's "Dictionnaire de l'architecture française."

gavelkind (gav'el-kind), *n.* [*< Ir. gabhail-cine*, *gabhail*, a taking (a tenure), = Gael. *gabhal*, a taking, a lease, farm, = *W. gafal* = Corn. *guel*, a hold, holding, tenure (see *gavel*), + *Ir. cine*, a race, tribe, family (cf. *W. cennid*, a tribe).] 1. Originally, in *old Eng. law*, the tenure of land let out for rent, including in that term money, labor, and provisions, but not military service; also, the land so held. The most important incident of this tenure was that upon the death of the tenant all his sons inherited equal shares; if he left no sons, the daughters; if neither, then all his brothers inherited equal shares. When the feudal system introduced the law of primogeniture, the county of Kent and some other localities were privileged to retain this ancient custom of inheritance.

Miss Rossetti comes commended to our interest, not only as one of a family which seems to hold gains by the tenure of *gavelkind*, but as having a special claim by inheritance to a love and understanding of Dante.

Lowell, Among my Books, 2d ser., p. 47.

Hence—2. In general use, land in Great Britain or Ireland, or an estate therein, which by custom having the force of law is inheritable by all the sons together, and therefore subject to partition, instead of going exclusively to the eldest. The word has been used in the following different senses, of which only the first and second are strictly correct: (a) socage tenure in England before the Conquest (see *socage*); (b) immemorial socage tenure in the county of Kent, England; (c) the body of customs allowed on ancient socage lands in Kent; (d) the customs of partible descent in Kent; (e) any custom of partition in any place. *Ellou*, Irish *gavelkind*, the holding of a member of a sept which, by Irish custom, was not at his death divided among his sons, but was included in a redistribution of all the lands of the sept among the surviving members of the sept.

The landholders held their estates by . . . an extraordinary tenure, that of Irish *gavelkind*. On the death of a proprietor, instead of an equal partition among his children, as in the *gavelkind* of English law, the chief of the sept . . . made, or was entitled to make, a fresh division of all the lands within his district.

Bairns' part of gear, in *Scots law*, same as *legitim*.

Differential gear. See *differential*.—**Driving-gear**, those parts of a machine which are most nearly concerned in effecting motion, as, in a locomotive, the parts from the cylinder to the wheels inclusive.—**Full backward gear**, with the valve-gearing adjusted to produce backward motion of the steam-engine.—**Full forward gear**, with the valve-gearing adjusted to produce forward motion of the engine.—**Guids and gear**, all one's property. [*Scotch*.]—**Inside gear**, the English arrangement of pitmans and cranks inside the frame of a locomotive, as distinguished from the American method of attaching the cross-heads to the engines to the wrists on the exterior of the driving-wheels by pitmans.—**Internal gear**, a wheel having its cogs on the internal perimeter. **Out of gear**, not in working or running order; not in a condition for use or operation.

Its own [the North's] theory and practice of liberty had got sadly out of *gear*, and must be corrected.

Emerson, *Address*, Soldiers' Monument, Concord.

Then sware Lord Thomas Howard: "Fore God I am no coward!

But I cannot meet them here, for my ships are out of *gear*."

Tranquon, *The Revenge*.

Overhead gear, driving-gear above the object driven.

Rope driving-gear, ropes used as a substitute for belting in the transmission of power from a driver to machinery.

Running-gear, the running-rigging of a vessel. (For other kinds of gear, see *bevel-gear*, *cone-gear*, *counter-gear*, etc.)

gear (gēr), *v.* [*< gear, n.*] **I. trans.** To put into gear; prepare for operation; fit with gear or gearing: as, to *gear* up a wagon; to *gear* a machine or an engine.—**Geared brace**, engine, etc. See the nouns.

II. intrans. In *mach.*, to fit into another part, as one part of gearing into another. See *gearing*.

gear-box (gēr'boks), *n.* A box inclosing gearing to protect it.

The effect of the same amount of resistance on each wheel will become unequally operative in the *gear-box*, and that defeats the whole object of the contrivance.

Bury and Hilber, *Cycling*, p. 383.

gear-cutter (gēr'kut ēr), *n.* One who or that which makes toothed or geared wheels for transmitting motion in machinery; specifically, a machine for cutting the teeth of a geared wheel. Gear-cutters are frequently grinding machines, an emery-wheel being used to cut away the superfluous

material between the cogs or teeth. The shape of the emery-wheel determining the shape of the inter-dental space, and consequently determining the shape of the teeth. Milling cutters are also much used. Gear-cutting machines usually have the shape of a lathe, the blank being supported on the mandrel, and the cutting wheel by the tool rest. The number and pitch of the teeth are regulated by a graduated disk attached to the mandrel, and the cutter is driven by various systems of gearing. Large machines have been made to work as planers, and arranged for every variety of angle and level gearing. Wood-working gear-cutters are rotary cutters (molders), and are used to cut wooden patterns for casting gears. Gear-cutters are also made to cut wheels of epicycloidal form. A gear-cutting attachment is also used with some milling machines. See *odontograph*.

gearing (gēr'ing), *n.* [Verbal *n.* of *gear, v.*] 1. Gear; dress; harness.—2. In *mach.*, the parts collectively by which motion communicated to one part of a machine is transmitted to another; specifically, a train of toothed wheels for transmitting motion.

There are two chief sorts of toothed gearing, namely, *spur-gearing* and *bevel-gearing*. In the former the teeth are arranged round either the concave or the convex surface of a cylindrical wheel in the direction of radii from the center of the wheel, and are of equal depth throughout. In bevelled gearing the teeth are placed upon the exterior periphery of a conical wheel in a direction converging to the apex of the cone, and the depth of the teeth gradually diminishes from the base. See *bevel*, and *cut under bevel-gear*.

Angular gearing. See *angular*. **Beveled gearing**. See *bevel*. **Conical gearing**, a gearing arrangement in which the motion is transmitted by a pair of beveled cones through interposed pinions.

Elliptical gearing, geared wheels of an elliptical shape, used to obtain a rotary motion of variable speed; also called *elliptical wheel*.—**Hooked gearing**, a form of gearing having the teeth set somewhat obliquely across the face of the wheel, so that the contact of each tooth begins at its forward end and ceases at the opposite end. The spiral has such a pitch that one pair of teeth remains in contact until the next pair comes together.

Hooke's gearing [named for Robert Hooke, an English mathematician and philosopher (1635-1703)], a kind of gearing for wheels in which the teeth are cut in a helical form.—**Multiplying gearing**, in *mach.*, a combination of cog-wheels in common use for imparting motion from wheels of larger to those of smaller diameter, so as to increase the rate of revolution.

Quick-return gearing, in some forms of planing machines, a system of mechanism fitted to the feed for causing the bed to return at increased speed after each cutting stroke. The stroke is slow, and the return to the first position is accelerated in order to save time.

Spiral gearing, two cylinders set parallel, and having spiral ribs and grooves that mesh or gear together.

Stepped gearing, a form of gearing in which each tooth or cog on the face of a wheel is replaced by a series of smaller teeth arranged in steps. The device is allied to the stepped rack, and is used to obtain a more uniform and continuous bearing between the teeth.—**Worm gearing**. Same as *spiral gearing*.

gearing-chain (gēr'ing-chān), *n.* In *mach.*, an endless chain transmitting motion from one toothed wheel to another, the teeth of the wheels fitting into the links of the chain.

gear-wheel (gēr'hwēl), *n.* Any wheel having teeth or cogs which act upon the teeth of another wheel to impart or transmit motion.—**Annular gear-wheel**. See *annular*.

Double gear-wheel, a wheel having two sets of cogs, differing in diameter, to drive two pinions. Such a wheel sometimes is driven by one pinion and drives the other.

gelatin, gelatine (jel'a-tin), *n. and a.* [= D. *Gelatin*, = Dan. Sw. *gelatin*, < F. *gelatine* = Sp. *gel.* H. *gelatina*, < NL. *gelatina*, < L. *gelatus*, pp. of *gelare*, freeze; see *geal*, *gelid*, *jelly*.] I. *n.* A concrete animal substance, transparent, hard, and tasteless, which swells without solution in cold water, dissolves in warm water and in acetic acid, and is insoluble in alcohol or ether. Gelatin does not exist as such in the animal tissues, but is formed by the action of boiling water on connective tissues, cartilage, ligaments, and tendons, as well as on skin, horn, fish-scales, etc. The coarser form of gelatin from hoofs, hides, etc., is called *glue*; that from skin and finer membranes is called *size*; and the purest gelatin, from the air-bladders and other membranes of fish, is called *isaglass*. Its leading character is the formation of a tremulous jelly when its solution in boiling water cools. A yellowish-white precipitate is thrown down from a solution of gelatin by tannin, which forms an elastic adhesive mass. Tannin has the same action also on the tissues from which gelatin is made, and this action of tannin is the foundation of the art of tanning leather. Gelatin is nearly related to the proteids. It is regarded as a nutritious food, and much used in preparing soups, jellies, etc.; but animals fed exclusively on it die with the symptoms of starvation. No chemical formula has yet been deduced for gelatin. It contains about 18 per cent. of nitrogen, 0.6 per cent. of sulphur, 50 of carbon, 7 of hydrogen, and 23 of oxygen. (See *jelly*.) In all the arts allied to photography, gelatin forms the basis of a great variety of processes. It is at present the usual vehicle for holding the sensitive salts of silver in dry plates, and for holding the sensitive bichromate of potash in all the photo-printing and photo-engraving processes. (See *emulsion*, *carbon process* (under *carbon*), *photolithography*, *helio-type*, and *photography*.) Gelatin is also used to form the copying-pad in a variety of copying processes. See *heliography*. **Chromatized gelatin**. See *chromatize*.

Explosive gelatin, a very powerful explosive compound made by dissolving gun cotton in nitroglycerin heated gently in a water-bath. A small amount of gum camphor may be added to diminish its sensitiveness. For military purposes it has been made of 90 per cent. of nitroglycerin and 10 per cent. of soluble nitrocellulose or gun cotton. To make the emporated compound, 60 per cent. of the above mixture and 4 per cent. of camphor is used. This preparation forms a gelatinous, elastic, translucent, pale yellow mass (specific gravity 1.6), of about the consistency of a very stiff jelly, which can be easily cut with a knife. (Cf. *E. Munroe*.) Also called *gun-dynamite*. **Gelatin culture**. See *culture*. **Gelatin of Wharton**, or *jelly of Wharton*, a kind of mucoid connective tissue which constitutes most of the bulk of the umbilical cord. **Gelatin process**, any photographic process in which gelatin enters as a basis or an element. **Gelatin sugar**. In *zool.*, the process of reproduction by buds; the formation of a new individual by the protrusion and complete or partial separation of a part of the parent; budding. Gemmation, when complete, is a kind of fission, but the part budded is commonly small in comparison with the size of the parent.

Gemmation consists in the production of a bud or buds, usually from the outside, but sometimes from the inside, of an animal; which buds become developed into more or less completely independent beings. The fresh beings thus produced by budding are all known as zooids. . . . When the zooids produced by budding remain permanently attached to one another and to the parent organism which produced them, the case is said to be one of "continuous" gemmation, and the ultimate result of this is to produce a colony or composite structure, composed of a number of similar and partially independent beings, all produced by budding, but all remaining in organic connection.

3. In *gram.*, a formal distinction in words, apparently founded on and in part expressing differences of sexual character, as male and female, or as male, female, or of neither sex (neuter). In the Semitic languages the genders are only two, masculine and feminine, and the distinction is made also in the second and third persons of verbs. In the majority of languages distinction of gender is altogether wanting. In some tongues differences not of sex are made the ground of formal distinc-

tions also called by some by the name *gender*, thus, that of animate and inanimate objects in American languages; a manifold distinction (of obscure origin) in South African languages, and so on. Some languages, like the modern French, have lost the neuter gender, and have masculine and feminine only; some, like English, have no gender except in a few pronouns, as *he, she, it*; some, like modern Persian, have no gender what ever.

3. Milit., an officer holding a general com-
mand (whence the title); the commander of an
army, or of any organization of troops larger
than a regiment: as an official title, used either
alone for the highest or next to the highest rank,
or with an adjunct designating the particular
grade. See *lieutenant-general*, *major-general*, and
brigadier-general. In modern European armies the
specific rank of general is usually the highest under that
of marshal or field-marshal. In the United States the title,
when used, is that of the acting commander-in-chief of the
whole army (the President being the titular commander-
in-chief). The rank has been held, under temporary laws,
only by Generals Washington, Grant, and Sherman, and
for a short time before his death in 1888 by General Sheri-
dan, whose previous title as commander-in-chief was lieu-
tenant-general. In address and common speech any gen-
eral officer is called *general* simply. Abbreviated *Gen.*

der the same rule: as, the *general* of the Domini-
cans, or of the Jesuits. In most orders the office is
held for three years, but in that of the Jesuits it is held
for life. The *general*, being subject to the immediate ju-

but has the right to sit and vote with the bishops in a gen-
eral council of the church.

Extreme cases are, ipso nomine, not *generalizable*. *Cobden.*

generalization (jen'gral-i-zā'shun), *n.* [= *F. généralisation = Sp. generalización; as generalize + -ation.*] 1. The act of generalizing; recognition of a character as being common to two or more objects; also, the process of forming a general notion.

Although, for example, we had never seen but one rose, we might still have been able to attend to its colour, without thinking of its other properties. This has led some philosophers to suppose that another faculty besides abstraction, to which they have given the name of *generalization*, is necessary to account for the formation of genera and species. *D. Stewart, Elements, iv. § 1.*

2. Induction; an inference from the possession of a character by each individual or by some of the individuals of a class to its possession by all the individuals of that class; the observation that the known individuals of a species, or the known species of a genus, have a character in common, and the consequent attribution of that character to the whole class; also, a conclusion so reached.

In our inquiries into the nature of the inductive process, we must not confine our notice to such *generalizations* from experience as profess to be universally true. *J. S. Mill, Logic, III. xxiii. § 1.*

When we have proved with respect to the circle that a straight line cannot meet it in more than two points, and when the same thing has been successfully proved of the ellipse, the parabola, and the hyperbola, it may be said down as a universal property of the sections of the cone. . . . It would be difficult to refuse to the proposition arrived at, the name of a *generalization*. . . . But there is not induction. *J. S. Mill, Logic, III. ii. § 2.*

I am not going to attempt a definition of the Anglo-Saxon element in English literature, for *generalizations* are apt to be as dangerous as they are tempting. *Lowell, Study Windows, p. 246.*

3. In *math.*, the process or result of modifying a proposition so as to obtain another having wider subject and predicate, but such that a limitation which, if applied to the new subject, gives the old subject, will reproduce the old predicate when applied to the new. For example, Fermat's theorem is that if p is any positive prime number and a any number not divisible by p , then the division of $a^p - 1$ by p leaves 1 as the remainder. A generalization of this is, that if k is any positive integer, and dk the number of numbers as small as k and prime to it, and a is any number relatively prime to k , then the division of $a^{dk} - 1$ by k leaves 1 as the remainder; for when k is a prime number, $dk = k - 1$, and every number not divisible by k is prime to it. The language of mathematics differs from that of logic in that from every generalization of a proposition the proposition itself is immediately deducible, which is not true in the logicians' sense of the word. The distinction between *generalization* and *extension* in mathematical language is not very clear, but the latter term applies primarily to a conception or function which has received a new and wider definition; also, the modification of a proposition concerning two dimensions so as to make it apply to three is called an *extension*.

Also spelled *generalisation*.
generalize (jen'gral-iz), *v.*; pret. and pp. *generalized*, pp. *generalizing*. [= *D. generaliseren = G. generalisieren = Dan. generalisere = Sw. generalisera, < F. généraliser = Sp. Pg. generalizar = It. generalizzare; as general + -ize.*] 1. *trans.* 1. To render general; make more general; bring under a general description or notion; treat or apply generically.

The mind makes its utmost endeavors to *generalize* its ideas. *Bolingbroke, Human Knowledge, § 5.*

We have already observed the following remarkable things in the process of naming: 1, assigning names of those clusters of ideas called objects; 2, *generalizing* those names, so as to make them represent a class; 3, framing adjectives by which minor classes are cut out of larger. *James Mill, Analysis, ix.*

The existence of a man with such mighty powers of discovery and demonstration as Newton, and the recognition of his doctrines among his contemporaries, depend upon causes which do not admit of being *generalized*. *Sir G. C. Lewis, Authority in Matters of Opinion, ix. § 1.*

2. To infer inductively, as a general rule from a particular case or set of facts.

A mere conclusion *generalized* from a great multitude of facts. *Cobden.*

3. In *math.*, to modify, as a proposition, so as to obtain a wider proposition from which the former can be immediately deduced. See *generalization*, 3.—**Generalized coordinates.** See *coordinate*.

II. *intrans.* 1. To recognize that two or more objects have a common character; to form a general notion. [Brought into use by Reid.]

We are next to consider the operations of the understanding, by which we are enabled to form general conceptions. These appear to me to have three:—First, The resolving or analyzing a subject into its known attributes, and giving a name to each attribute, which name shall signify that attribute, and nothing more. Secondly, The observing one or more such attributes to be common to many subjects. The first is by philosophers called abstraction; the second may be called *generalizing*; but both are commonly included under the name of abstraction. *Reid, Intellectual Powers (1785), p. 445.*

2. To reason inductively, from particular cases to general rules comprehending those cases.

The older *geneses*, whether of the world or of mind, are so simple and ultimate, have been founded to such epic completeness and sublimity, that, as they are superseded by still larger and loftier conceptions, their dissolutive phases are often pathetic. *Amer. Jour. Psychol.*, I. 156.

4. [*cap.*] The first book of the Old Testament. It records the creation of the world, the flood and the ensuing dispersion of races, and a more detailed history of the families of the Hebrew patriarchs Abraham, Isaac, and Jacob. The traditional and still widely prevalent view ascribes the authorship to Moses. Many modern scholars, however, find strong evidences of various periods of authorship, and particularly of two chief sources, the so-called *Jehovistic* and *Elohistic*. According to the latter view, the dates of composition fall chiefly within the period of the kingdoms of Judah and Israel (about the eighth century B. C.), the last redaction occurring perhaps after the return from Babylon. In Hebrew the book is designated by its first word, *Bereshith*, 'In the beginning'; the title *Genesis* was supplied in the early Greek translation. Abbreviated *Gen.* See *documentary hypothesis* (under *documentary*), *Elohistic*, *Jehovistic*.

It. genitivo*, *< L. genitivus*, usually in classical *L.* spelled *genetivus*, of or belonging to birth; in grammar, with or without *casus*, the genitive case (a mistranslation of *Gr. ἡ γενική πρῶσις*, the generic or general case, *γενικός* meaning also belonging to the family, also to generation, *< γένος* = *L. genus*), *< genitus*, pp. of *gignere*, *OL. genere*, beget, produce; see *genital*, *genus*.] **I. a.** In *gram.*, pertaining to or indicating origin, source, possession, and the like; an epithet applied to a case in the declension of nouns, adjectives, pronouns, etc., which in English is called the possessive case, or to the relation expressed by such a case; as, *patris*, 'of a father, a father's,' is the *genitive case* of the Latin noun *pater*, a father.

What is your *genitive* case plural, William?

Shak., M. W., iv. 1.

II. n. In *gram.*, a case in the declension of nouns, adjectives, pronouns, etc., expressing in the widest sense a relation of appurtenance between one thing and another, an adjectival relation of one noun to another, or more specifically source, origin, possession, and the like; in English grammar, the possessive case.

The Latin *genitivus* is a mere blunder, for the Greek word *γενικός* could never mean *genitivus*. . . *Genike* in Greek had a much wider, a much more philosophical meaning. It meant *casus generalis*, the general case, or rather the case which expresses the genus or kind. This is the real power of the *genitive*. If I say, 'a bird at the water,' 'of the water' defines the genus to which a certain bird belongs; it refers to the genus of water birds. 'Man of the mountains' means a mountaineer. 'Hoplites such as 'son of the father' or 'father of the son,' the *genitives* have the same effect. They predicate something of the son or of the father, and if we distinguish between the sons of the father and the sons of the mother, the *genitives* would mark the class or genus to which the sons respectively belonged. *Max Müller, Sci. of Lang.*, iii.

genius (jē'nus), *n.*; *pl. genivuses, geni* (jē'nus-ez, -ni). [*L. genius*, the tutelary spirit of a person, spirit, inclination, wit, genius, lit. 'inborn nature' (nature is from the same root). *< gignere*, *OL. genere*, √ *gen*, beget, produce; see *genus*.]

1. The ruling or predominant spirit of a place, person, or thing; the power, principle, or influence that determines character, conduct, or destiny (supposed by the ancients to be a tutelary divinity, a good spirit, or an evil demon, usually striving with an opposing spirit for the mastery); that which controls, guides, or aids; as, my good *genius* came to the rescue; his evil *genius* enticed him. [In this sense and the following the plural is *genii*.]

Some say, the *Genius* so

Cries, "Come!" to him that instantly must die.

Shak., T. and C., iv. 4.

The word *genii* hath by some writers been erroneously adopted for *genivuses*. Each is a plural of the same word *genius*, but in different senses. When *genius* in the singular means a separate spirit or demon, good or bad, the plural is *genii*; when it means mental abilities, or a person eminently possessed of these, the plural is *genivuses*. *G. Campbell, Philos. of Rhetoric*, II. iii. 3.

A fairy shield your *Genius* made,

And gave you on your natal day.

Templeton, Margaret.

After the third century, even the artistic type of the guardian *genius* disappeared in that of the guardian angel. *Locky, Enrop. Morals*, I. 244.

His [Shakespeare's] evil angel, rhyme, yielding step by step and note by note to the strong advance of that better *genius* who came to lead him into the loftier path of Marlowe.

Swainburne, Shakespeare, p. 32.

2. A disembodied spirit regarded as affecting human beings in certain ways, but not as connected with any one individually.

The Abyssinians, to a man, are fearful of the night, unwilling to travel, and, above all, to fight in that season, when they imagine the world is in possession of certain *genii*, averse to intercourse with men.

Revue, Source of the Nile, II. 26.

3. A type or symbol; a concrete representative, as of an influence or a characteristic; a generic exemplification.

I do remember him at Clement's Inn, like a man made after supper of a cheese-paring; . . . he was the very *genius* of foppishness. *Shak., 2 Hen. IV.*, iii. 2.

A golden beard—the very *genius* of desolate stillness—had stopped breathless upon the threshold of our camp. *Bret Harte, Eddy Sylvester (Tale of the Algonquian)*.

4. Prevailing spirit or inclination; distinguishing proclivity, bent, or tendency, as of a person, place, time, institution, etc.; special aptitude or intellectual quality; intrinsic characteristic or qualification; as, a *genius* for poetry, or for diplomacy; the *genius* of Christianity, of the Elizabethan period, of the American Constitution, of the Vatican.

Taking with him his two Sisters, he retired into a Monastery, they into a Nunnery. This does not suit with the *Genius* of an Englishman, who loves not to pull off his clothes till he goes to bed. *Howell, Letters*, I. iii. 11.

Every age has a kind of universal *genius*, which inclines those that live in it to some particular studies.

Darwin, Essay on Dram. Poetry.

No woman can despise them for remedies, with impunity. Then *genius* delights in ceremonies, in tomes, in decorating life with manners, with propriety, order, and grace. *Emerson, Woman*.

It is this tendency on the part of the collective speakers of a language to approve or reject a proposed change according to its conformity with their already subsisting usages that we are accustomed to call by the fanciful name 'the *genius* of a language.'

Whitney, Lincey, Brit., XVIII. 770.

Human nature has a much greater *genius* for sameness than for originality. *Lowell, Study Windows*, p. 63.

5. Exalted mental power distinguished by instinctive aptitude, and independent of tuition; phenomenal capability, derived from inspiration or exaltation, for intellectual creation or expression; that constitution of mind or perfection of faculties which enables a person to excel others in mental perception, comprehension, discrimination, and expression, especially in literature, art, and science.

By *genius* I would understand that power, or rather those powers of the mind, which are capable of penetrating into all things within our reach and knowledge, and of distinguishing their essential differences.

Fiddling, Tom Jones, iv. 1.

Genius always imports something inventive or creative.

H. Blair, Rhetoric, iii.

We owe to *genius* always the same debt, of lifting the curtain from the common, and showing us that divinites are sitting disguised in the seeming gang of gypsies and peddlers.

Emerson, Works and Days.

Talent is that which is in a man's power; *genius* is that in whose power a man is.

Lowell, Among my Books, 1st ser., p. 356.

6. A person having such mental power; a person of general or special intellectual faculties developed in a phenomenal degree. [In this sense the plural is *genivuses*. It was formerly also *genii*.]

Johnson.

E. J. Freeman, Venice, p. 141.

Genius loci. [1.] The presiding divinity of a place; hence, the pervading spirit of a place or an institution, as of a college. See def. 1. = *Syn.* 5. *Abilities, Gifts, Talents, Parts, Aptitude, Faculty, Capacity, Genius, Innateness, Cleverness*, all indicate special or excellent power for doing work that is more or less intellectual. *Abilities* is the most general and common word for intellectual powers of the active sort, intellectual competence to do effective work; *abilities* are always either acquired or developed. (See *ability*) *Gifts* are strictly endowments, or abilities regarded as conferred by the Creator. (See *acquirement*.) *Talents* comes to the same idea, its Biblical origin (*Mat. xxv.* 14-30) making the powers seem primarily intrusted to one for use, or at least given like money. *Parts* is regaining its former popularity and dignity, which it lost for a time; in the last century it stood for *talents* or *gifts*, excellent or superior endowments; as, he is a man of parts, or he is a man of good natural parts, the latter perhaps implying a failure to develop one's gifts. *Aptitude* is either natural bias or special fitness or skill; it may be native talent or disciplined ability. *Faculty* is cultivated aptitude, a highly trained power of doing something. The distinction between a *faculty* for and the *faculty* of should be noticed, the former being the kind of *faculty* now under consideration and the latter a bodily *faculty*, as the *faculty* of speech, hearing, etc. *Capacity* is receptive power; as, capacity to learn; it is a power of acquiring. (It is most remarkable in the different degrees of facility with which different men acquire a language.) *Sir J. Mackintosh*, (See *ability*.) *Genius* is extraordinarily developed faculty, in many directions or in one; it is especially the creative power of original conceptions and combinations; it belongs with *talents* or *gifts* in seeming primarily bestowed, not acquired, and it includes *capacity* and *aptitude* in their highest forms. *Intuition* is lower than *genius*, in seeming cultivated, not bestowed, in seeming less superhuman or phenomenal, and often in serving less exalted purposes; as, the *intuition* of the mechanic, of the rhetorician, of the sophist. *Cleverness* is still lower, being a sort of mental dexterity, which is exalted in facility in learning or felicity in expression; it may be a merely manual dexterity. (See quotation from Coleridge under *cleverness*.) It should be noticed that all these words, except *parts*, may be used in the singular for skill or power or natural bent in some particular direction; as, *ability* in debate, a *talent* for drawing, the *out* of conversation, an *aptitude* for scientific research, *intuition* in argument, etc. (See *wisdom* and *instinct*.)

As we advance in life, we learn the limits of our *abilities*.

Freud, Short Studies on Great Subjects, II. 513.

Conversation is its better part.

May be extended a *genii* at a not an art.

Cooper, Conversation, I. 4.

The man of *talents* possesses them like so many tools, does his job with them, and then an end; but the man of *genius* is possessed by it, and it makes him into a tool or a life according to its whim.

Lowell, Fireside Travels, p. 64.

All my endeavors to distinguish myself were only for want of a great title and fortune: that I might be used like a lord by those who have an opinion of my *parts*; whether

right or wrong is no great matter. And so the reputation of wit and great learning does the office of a riband or a coach and six.

Scept. To Bolingbroke.
